Introduction: With a multitude of different MS instrumentation and data analysis software platforms available for MS and proteomics it becomes difficult to manipulate and manage various data sets. Recently we presented a software application that will allow the conversion of processed MS data files obtained on a variety of instruments into several common formats accepted by different software applications. We have further developed the program to add support for the mzXML¹ format and incorporate a front end interface which may be linked to several web based database searching engines including Mascot, ProteinProspector and BUPID² (a peptide mass fingerprinting program based on a log-likelihood ratio model developed here at BUSM).

Methods: The data processing software was developed using Microsoft Visual Basic 6.0. To add support for mzXML format, we used MSXML 4.0 as an XML parser and built a visual C++ library to decode Base64 encoded peak list data in the mzXML file. Other supported data formats are intermediate files converted from raw data files using manufacturers' software: LC MS/MS data is processed with Analyst QS (ABI/Sciex), MassLynx/PLGS2.1 (Waters); and MALDI MS data with MOverZ (Proteometrics LLC); and FTMS data with BUDA³ (BUSM). The BUPID program was developed in C under Linux and made accessible to the main program through a CGI based web interface.

Results: The shell data conversion program was written to implement a user friendly GUI interface which may be operated in an unattended batch processing mode. Testing of the program was performed on existing MALDI-TOF MS, MALDI-FT MS and LC MS/MS data sets obtained in house. The program allowed the conversion of large volumes of data obtained on different instruments to the formats of several commercially and publicly available search engines. Files were then submitted for protein identification to the search engines with the search settings specified by the user. For a batch of files, the search setting only needs to be specified once, thus allowing unattended operation. Results files are automatically saved in HTML format and can then be viewed directly inside the program. Our recent implementation of the mzXML format introduced by the Institute for Systems Biology affords the benefits of a common data format for summation of results obtained on different MS platforms, comparative analysis of MS methodology and archiving of data such that it may be analyzed at a later date in-house or at a different facility.

Conclusions: The software provides an easy-to-use graphical interface for automatic MS data conversion and database searching. It can also be easily be expanded for more MS data types and linked to more database search engines.
