Histopathology

Course Information

In this course, we study the fundamental knowledge and practical experience of human and animal histology and pathology.

Students are familiarized with biospecimen processing and management at the organ, tissue, cellular and molecular levels. By studying different organs and organ systems, students develop an understanding of the normal and diseased state at the macro and microscopic levels.

The course is reinforced with applied, hands-on laboratory sessions that would provide practical experience in the topics covered in the didactic lectures. The students learn how to dissect, preserve, process, section, and stain tissue.

The small class size ensures that all students are provided with adequate hands-on time and adequate time for interaction with course instructors.

Course Director:
Dr. Mostafa Belghasem
