DEPRESSION AND HEALTH LITERACY OVER THE LIFESPAN

Tetine Sentell, University of Hawai‘i
Jennifer Manganello, University at Albany
Alessio Farcomeni, University of Rome
Yan Yan Wu, University of Hawai‘i

HARC 2014
November 3, 2014
Depression is a common psychiatric disorder in children, adolescents, adults, and the elderly. Depression is associated with higher risk of illness, unhealthy behavior, and interpersonal and psychosocial difficulties that can persist long after the depressive episode is over.
Health literacy has been associated with depression in many studies.

However the strength of evidence “low” (Berkman et al, 2011)
- “Despite the general consistency of results, only 1 depression study rigorously controlled for potential confounders.”

Studies in very specific populations.
Few studies have explored the relationship of health literacy to health status over the lifespan.

Health literacy skills most relevant to adolescent health may vary from those most critical in young adulthood, middle adulthood, and older age.
Previous study found that the relationship between self-reported health and domains related to low health literacy varied:
- Over domains
- Over the lifespan

Data was from adolescence to mid-adulthood.

What about depression over the lifespan?

Consider the relationship between depression and health literacy over the life course.
THREE DATA SETS

- 2012 Hawaiʻi BRFSS
- 2007 CHIS
- ADDHealth
Behavioral Risk Factor Surveillance System (BRFSS) is the world’s largest ongoing telephone survey of adults.

The BRFSS is coordinated by the Centers for Disease Control and Prevention (CDC).

2012 Hawai‘i BRFSS

N= 7,582
Low health literacy

- How confident are you filling out medical forms? Not at all, a little bit, somewhat, quite a bit, extremely
  - 19.2%

Depression

- Were you ever told you had a depressive disorder?
  - 13.1%

Age Groups

- 18-24, 25-34, 35-45...75-84, 85+
% DEPRESSION BY AGE GROUP AND HEALTH LITERACY

Adjusting for gender, marital status, insurance, education, income, race, rural, born in the US.

**Interaction Age*HL were not significant!**
LIMITATIONS

- Dataset specific limitations
  - States
  - Variables not available
- Cohort effects?
- Only one health literacy measure
National Longitudinal Study of Adolescent Health (AddHealth) data from four time intervals across 20 years.

- From adolescence to mid-adulthood
- N=3,333

**Time 1**
1994-1995
Grades 7 to 12

**Time 2**
1996

**Time 3**
2001-2002
Ages 18 and 26

**Time 4**
2008
Ages 24 to 32
DOMAINS

- Vocabulary
- Math
- Health information learned in school
“HEALTH LITERACY” DOMAIN VARIABLES

- All obtained from the first time interval
  - Subjects were in grades 7-12.
- Vocabulary was measured by the AddHealth Peabody Picture Vocabulary Test
  - Low vs not low vocabulary
- Math skills were measured from math grades in school
  - High vs. not high
- Health information was measured as a continuous variable created from 17 items regarding whether the topic had been covered in school.
  - Continuous in models
  - Dichotomized in descriptive statistics
- Depression
  - Measured by the CES-D (0-60)
  - Gender specific cut points
  - Measured at four time intervals
% DISTRESS BY AGE GROUP AND HEALTH LITERACY

</tbody>
</table>

Adjusting for education, race, access to care, English household. Gender specific-cut points.
RESULTS

- Math and vocabulary (and, marginally, health info in school) were significantly associated with depression across the whole time period.
- Health information is strongest at waves 1 and 2 and then mitigates to a null effect in later waves.
LIMITATIONS

- Challenges in measurement
  - Not standard health literacy measures
  - Other domains in health literacy
  - Health literacy measures only in Time 1

- Points in time
  - Varied ages
  - Different life events
Health literacy variation over lifespan
  - May help explain differences across studies
  - Further research!
This research uses data from Add Health, a program project directed by Kathleen Mullan Harris and designed by J. Richard Udry, Peter S. Bearman, and Kathleen Mullan Harris at the University of North Carolina at Chapel Hill, and funded by grant P01-HD31921 from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, with cooperative funding from 23 other federal agencies and foundations. Special acknowledgment is due Ronald R. Rindfuss and Barbara Entwisle for assistance in the original design. Information on how to obtain the Add Health data files is available on the Add Health website (http://www.cpc.unc.edu/addhealth). No direct support was received from grant P01-HD31921 for this analysis.
THANK YOU! MAHALO!
