You are invited to participate in a research study at Boston University. The goals of the study are (1) to examine how Parkinson’s disease (PD) affects visual (motion) perception and movement; and (2) to investigate ways to improve visual and motor skills in PD.

We are looking for volunteers:

- **Who are diagnosed with PD without dementia AND experience difficulty walking because of the disease.**
- **Who do not have PD or any other neurological disorder.**

For volunteers with PD:
(1) Two lab sessions, one week apart, with tests of perception, motor function, thinking and mood.
(2) An at-home portion, where you will complete a 30-minute vision task daily for one week. While at home, we will give you an “activity monitor” (a small, non-invasive watch-like device) to wear for the week. This monitors your symptoms of PD while you go about your daily life.

For volunteers without PD:
(1) One lab session with tests of visual perception, motor function, thinking, and mood.

You will be reimbursed for your time, and for parking.
