

Navigating Research Excellence: Applying GCP through Real-World Case Studies

June 11, 2024

Mary-Tara Roth, RN, MSN, MPH – BUMC/BMC

Alexandria Carey, MSN, MBA-HC, RN, CNE, CPEN, CEN – UF

Kimberly Luebbers, MSHS, RN, BSN, OCN® – UVM

Diana Lee-Chavarria, MA – MUSC

Session Objectives:

- Describe GCP and the importance of aligning study operations to practices that are worldwide accepted standards for excellence in research
- Provide specific examples of how study conduct is aligned with GCP requirements
- Discuss real-world cases to best understand how to effectively and correctly integrate GCP and best practice standards to the conduct of your research

Agenda:

- Introduction – Eagle view of GCP
- What is GCP and why is it important
- GCP Principles
- GCP in Action Jamboard activity
- GCP Main Elements
- Cases for discussion

How to Get TB Patients to Take Their Pills? Persistent Texting and a 'Winners Circle'

The drug regimens can be grueling, and patients often quit taking their medications. But turning it into a cellphone competition helps.

Recent [mildly paraphrased] quote from an FDA scientist

“At the end of the day, all this stuff winds up being data.... Someone is going to look at all of the data, drop-out rates, compliance, etc. and determine: where is it hanging together and where is it not? Someone is going to deconstruct that sausage. If you’re part of the chain of where this gets screwed up you’re part of a \$100 million dollar effort that is screwed up.... if that data can’t be used.”

Human Subjects Protection Lapses and GCP

"What we have witnessed – esoteric or complex standards have not been the issue, but rather the most basic elements of what it takes to properly conduct clinical studies...

- Enrollment of patients who did not meet the eligibility criteria for the study;
- Failure to report adverse events as required;
- Failure to ensure that a protocol was followed;
- Inadequate training for study staff;
- Investigators changing protocols without proper notice to the IRB and to FDA;
- Failure to incorporate agreed-upon protocol changes..."

Dr. Jane Henney, Commissioner, FDA, May 11, 2000

From which scenario would you prefer data was used to support medical care that you or your family members receive in future?

Scenario A

Data recorded on subjects meets ALCOA-C standard (incl. signed/dated source documentation)

Delegation log shows which study staff were delegated to do what procedures; clear training SOPs were in place for the site; staff competency was assessed and documented as applicable to the task and role

Researchers and sponsor reported all outcomes of the investigational drug, both positive and negative

Full extent of data collection practices and sharing described to participants in the consent form and discussion

Data collection has audit trail showing creation, modification, deletion of records, including who/when

Protocol followed explicitly; modifications were IRB approved prior to implementation; Documentation shows protocol adherence

Scenario B

Data recorded does not meet ALCOA-C standard; source docs do not show who collected the data and when

No delegation logs; no detailed training records or training SOPs in place; no formal assessment of competency; staff just filled in where needed

Researchers and sponsor selectively reported positive outcomes and minimized harmful side effects of the investigational drug

Data collection practices were not fully described in the consent form and discussion

Data collection utilizes is an excel spreadsheet and MS Word document; it's not clear if and why any data was changed

No documentation showing protocol adherence; changes made to research if team determined they did not result in risk to subjects (ex: timing of drug administration)

WHAT is Good Clinical Practice (GCP)?

- An international ethical and scientific quality standard for:

- Designing
- Conducting
- Recording
- Reporting trials

- Applies to All Research involving Human Participants

WHY is GCP important?

Standard of Excellence

- Safety of Participants
- Quality of Data

RESPONSIBILITY for GCP is shared by all parties involved in research, including:

- FDA/other regulators
- Sponsors
- Contract Research Organizations (CROs)
- IRBs
- Investigators
- Study staff

An additional point of interest:

Regulatory Gaps can be Informed by ICH GCP Guidance

- Essential Documents
- Investigator and Sponsor Responsibilities
- Trial Management, Data Handling, and Record Keeping
- Monitoring
- Audits
- Non-Compliance
- Clinical Trial Reports
- Progress Reports
- Safety Reporting
- Publication Policy

13 GCP Principles

Ethics

- ... trials should be conducted in accordance with ethical principles that have their origin in the Declaration of Helsinki and are consistent with GCP and applicable regulatory requirements
- Before trial, foreseeable risks and inconveniences should be weighed against the anticipated benefit for the individual subject and society. Anticipated benefits must justify risks.
- Rights, safety, and well-being of subjects prevail over interests of science and society

Protocol and Science

- Nonclinical and clinical information must be adequate to support the proposed trial
- Trials should be scientifically sound and described in a clear detailed protocol

13 GCP Principles

Responsibilities

- Trials should be conducted in compliance with the protocol that has received IRB (ethics committee) approval prior to initiation
- Medical care given to/decisions on behalf of subject made by qualified physician/dentist
- Each individual is qualified (education, training, experience) to perform his/her tasks

Informed Consent

- Freely given from every subject prior to participation

Data Quality and Integrity

- All trial data should be recorded, handled, and stored in a way that allows its accurate reporting, interpretation, and verification
- Confidentiality of records should be protected...

13 GCP Principles

Investigational Products

- Manufacture, handling, storage should conform to Good Manufacturing Practice (GMPs) and used per protocol

Quality Control/Quality Assurance

- Systems with procedures that assure the quality of every aspect of the trial should be implemented

GCP in *Action!*

Let's try to operationalize some of the GCP Principles. *What do they really mean* in the context of real research studies, i.e., YOUR research studies?

GCP in Action activity instructions

- We will use Google Jamboard
- There will be 4 GCP Principles, each on a separate Jamboard
- You are assigned to a Jamboard based on the first letter of your last name
- We will post the 4 Jamboard links in Chat; select the link corresponding to your last name
- For “your” assigned GCP Principle, provide examples of how you would operationalize, or what you have implemented, in your study.
- Try to come up with as many specific examples as possible in 4 min.
- We’ll briefly review all of them together and then plan to post images of the finished Jamboards along with the slides and videos on the RPN Workshop library

GCP in Action Jamboard activity example

If you need more room click the >

Jamboard 5: For those with last name beginning with S thru Z

Provide examples of how you have or would operationalize/implement the following GCP Principle.

Use sticky notes (4th icon down in the menu to the left). If you need more room click the > symbol above for another page.

ICH GCP 2.3: The rights, safety, and well-being of the trial subjects are the most important considerations and should prevail over interests of science and society.

Jamboard 5: For those with last name beginning with S thru Z

Provide examples of how you have or would operationalize/implement the following GCP Principle.

Use sticky notes (4th icon down in the menu to the left). If you need more room click the > symbol above for another page.

ICH GCP 2.3: The rights, safety, and well-being of the trial subjects are the most important considerations and should prevail over interests of science and society.

Allow sufficient time for questions and discussion before obtaining participants' written consent.

Ensure that the informed consent form and consent discussion are complete and transparent.

Follow procedures to ensure the safety monitoring is performed adequately and that reporting is done promptly, completely, and per protocol and applicable SOPs.

Any previously unknown adverse event or issue that is identified that has the potential to increase risks to subjects should be reported to the IRB in expedited timeframe.

If there are new, previously unknown risks to subjects then changes should be made to the protocol or the study should be suspended/terminated.

Offer support services, such as counseling, if required, to address participants' emotional and psychological well-being during the study.

Obtain approval from an institutional review board (IRB) before starting the study.

Provide a dedicated contact point for participants to reach out with any questions, concerns, or issues.

Maintain open and clear communication with participants throughout the study.

Implement a robust system for monitoring, recording, and reporting adverse events (AEs) and serious adverse events (SAEs).

Jamboard 1

**Audits,
keeping a lock
boxes for
binders with
data**

**store data in
correct
correlated
folders on
shared drives**

Using standardized
forms to clearly
document visits or
phone calls, so
information is easy
to track and check
throughout the
study.

Providing original
source
documentation for
all eligibility criteria

**Accurate
and up to
date
checklists**

In my study, we
developed and
implemented
detailed SOPs for
data collection,
entry, verification,
and storage.

Ensuring that all
staff are trained on
procedures for data
collection, entry,
verification, and
storage.

If reorganizing data
for storage, do not
delete any files until
organization is
finished

Source
documentation that
is legible and
labeled with Study
ID

**Document it
or it didn't
happen!**

**Note to
files**

**Keep
track of
changes**

**consent
process**

Adequate secure
storage is used for
physical and
electronic data
collection. (thanks
REDCap!)

**ALCOA and
notes that
explain what
happened to
future people.**

Accurately filing and
documenting - if a
new or revised form
is needed or an item
is moved from
original place then a
note to file must be
used

Provide source
documents, SOPs,
designated duty
logs, eligibility
criteria, and
documentation of
the informed
consent process as
well as original ICFs.

**Use a software

that keeps an
audit trail.**

Conduct regular
"internal audits"
and spot checks to
review data quality
and compliance
with the study
protocol.

SOPs for the
collection of data are
completed and
checklists developed
to aid in ensuring all
required assessments
are completed and by
whom.

Inhouse email
thread with all PI's
and coordinators
documenting every
question and
decision.

**Creating and
adhering to
SOPs for
consistency**

record initial/ID for
anyone who records,
processes, or
manipulates ANY
data

Having original copy
of handwritten
signature and then
scan for copy to be
stored in a secure
way

**Restrict
access to
authorized
personnel
only.**

At our site we create
SOPs to follow to
ensure that for all of
our studies
information is
documented
similarly. This helps
eliminate any issues.

If there are changes
to the original
source, date and
initial the changes.
Make sure the
original entry
remains visible!

**following the
mop and sop
to stay
consistent**

**Any note to
files should be
signed and
dated by the
author.**

**Ask another
colleague to
QA/QC your
work.**

Jamboard 2

ICH GCP 2.9: Freely given informed consent should be obtained from every subject prior to clinical trial participation.

Informed consent training

Used a certified medical language interpreter to ensure that we obtained proper consent from a research participant who was primarily Spanish speaking.

informed consent process checklist to ensure meeting all regulatory requirements

Remember to use 8th grade level language and correct font, especially if an ICF is written for older people.

Time to answer all questions and if need, contact PI or additional study staff to verify questions for participant

Bring a patient into clinic to review the ICF and give time to think about participation before signing consent.

Provided a copy of the consent form ahead of time to the patient, so they can take it home and review on their own by themselves and with loved ones before they decide to consent.

Emphasize that research participation is voluntary

If possible have informed consent completed before the morning of the screening visit.

participants should freely give consent

Consent should be free from coercion.

Ensure consent language is at a reading level the subject can understand

ensure appropriate room setup ie private and comfortable space

subjects should be allowed time to ask questions.

Provide accessible documentation/information for subjects to reference throughout the study

use a checklist to document the informed consent process

Send ICF and summary to potential participants ahead of discussion for review

Check in throughout to offer breaks, ask if they have questions, remind that this voluntary

Avoid situations where consent is 'bought' instead of given

Ensure participants are clear that they can decline their consent at anytime

The EVERY subject jumped out at me. Ensure we offer it to everyone, even if it's inconvenient.

Participants should have the opportunity to discuss study participation with a family member and/or healthcare provider

Try to have study PI available to answer questions in real time if person requesting consent cannot answer

Ensure you are always using the stamped ICF

Have ICF in the language of intended population.

Using 2 page summary of study as introduction to access interest and then move forward with lengthy ICF

Document all the ways you have shared the study information (including the ICF) with the participant. They should include date and time signed so one can confirm it was signed before stu

Additional comments from workshop chat:

- informed consent process checklist to ensure meeting all regulatory requirements

Jamboard 3

ICH GCP 2.6: A trial should be conducted in compliance with the protocol that has received prior institutional review board (IRB) approval.

Ensure correct IRB approved versions of all relevant docs being used

Ensure that study visits occur on time and that all procedures are completed at visit. Procedures not written into IRB-approved protocol may not be performed

Ensure all team members have the most recent and updated protocol. This will make sure no deviations or increase risk happens for our enrolled participants.

If any changes are made to the study once it has started, make sure changes are not implemented until they are approved

Communicate with IRB throughout study!

Printing consent forms straight from Click when needed to avoid using outdated ICFs

Provide training to all staff on study protocol

Create a study cheat sheet/checklist based on schedule of events.

Internal checklist to confirm most up to date IRB ICF

Follow checklists and approved SOPs

Double check our IRB site to make sure we have full approval prior to enrolling anyone on the study

Keep track of all protocol deviations or adverse events, this can also help make sure the team stays true to the protocol as well as be potential revision opportunities.

Make sure study staff knows where to find the most recent versions of the protocol, ICF, etc.

Routine monitoring visits to make sure errors aren't being repeated

Keep a running log of all protocol deviations so that if/when they need to be reported to the sponsor or IRB the information is readily available.

Conduct internal QA audits to ensure the protocol is being followed correctly before a monitor or auditor comes.

Ensure all study staff are trained on the IRB-approved protocol, including refresher trainings when an amendment is approved

Provide internal training after SIV to ensure coordinators understand how the protocol will be followed based off of your site

Have continuing review items together in advance for the IRB

Ensure all key personnel are up to date with training for the most current IRB approved documents.

Additional comments from workshop chat:

- If possible have informed consent completed before the morning of the screening visit.
- Document that all KP are trained in the protocol and updates to the protocol.
- Regular internal QA of study documentation (study subject binders)

Jamboard 4

ICH GCP 2.8: Each individual involved in conducting a trial should be qualified by education, training, and experience to perform his or her respective task(s).

Became certified as a certified research coordinator and take all required CE courses to remain certification.

The development of a study-specific MOP is generated to provide appropriate guidance relating to study-specific procedures.

Maintain delegation logs that show that everyone's tasks were assigned appropriately.

Created tracking log for staff GCP expiration dates

Verification and maintenance of up to date staff credentials occurs regularly.

A study-specific training log has been created and kept up to date during the entirety of the study.

Organized trainings for new and existing team members

Encourage staff to pursue the CCRC certification

Copies of staff CVs and lab trainings need to be kept on file

Verify licensure requirements and collect a yearly update CV

Take part in the RPN work shop series

assured CPR certifications are up to date, and arranged for those that need to recertify

Study PIs ensure the timely and appropriate training of all study team members.

assigned tasks to the most capable based on team abilities and knowledge

Maintain the resume/CV of study staff to note education, certifications, and training.

The IRB ensures that the personnel on the study team have appropriate credentials and clearance to engage in the study activities in different aspects

Develop SOPs for onboarding new staff.

Additional comments from workshop chat:

- Keep up to date on your CITI trainings.

Main Themes of GCP

IRB oversight

Follow the Protocol

Ensure proper qualifications/training/competency

Informed consent

Documentation to support quality of conduct of the study

Safety Monitoring and Reporting

Quality of Data

Rights, Welfare, Safety of Research Participants

IRB oversight

The IRB should:

- safeguard the rights, safety, and well-being of all study subjects.
 - Special attention should be paid to studies that may include vulnerable subjects
- review and document its views in writing
- consider the qualifications of the investigator
- conduct continuing review

Follow the Protocol

- Protocol adherence is the responsibility of all research team members
- Ensure staff are trained on the protocol and amendments to the protocol
- Ensure consistent communication of the protocol details among the research study team
- Conduct the study in compliance with the protocol approved by the IRB, Sponsor, and applicable regulatory authorities (FDA)
- Do not implement any deviation from, or changes of the protocol without Sponsor agreement and IRB approval (except to eliminate an immediate hazard(s) to participants)

Ensure proper PI and study team qualifications/training/competency

- The investigator(s) and study staff should be qualified by education, training, and experience to assume responsibility for the proper conduct of the study/role in study
- Must have an adequate number of qualified staff and adequate facilities to conduct the study properly and safely
- Ensure that the PI and all persons assisting with the study are adequately informed about the protocol, the investigational product(s), and their study-related duties and functions
 - The investigator is responsible for supervising any individual to whom the investigator delegates study-related duties and functions

Informed Consent

- The investigator, or a person designated by the investigator, should fully inform the subject or LAR, of all pertinent aspects of the study
- No coercion or undue influence
- Participant should have time and opportunity to understand the study and ask questions to decide about participation
- The consent form should be signed and personally dated by the participant or LAR and the person who conducted the discussion

Documentation

- Essential Documents: individually and collectively permit evaluation of the conduct of a trial and the quality of the data produced
- The investigator should:
 - Maintain adequate and accurate source documents and trial records that include all pertinent observations on each of the site's trial subjects
 - Source data should be **attributable, legible, contemporaneous, original, accurate, and complete**
 - Ensure changes to source data are traceable, do not obscure original, and be explained if necessary
 - Ensure the accuracy, completeness, legibility, and timeliness of the data reported to the sponsor in the CRFs and in all required reports
 - Data on the CRF that are derived from source documents, should be consistent with the source documents

Safety Monitoring and Reporting

- Adverse events incl. lab abnormalities should be reported to the sponsor according to the reporting requirements specified in the protocol
- All serious adverse events (SAEs) should be reported immediately to the sponsor except for those SAEs identified as not needing immediate reporting
- The sponsor should promptly notify all concerned investigator(s)/institution(s) and the regulatory authority(ies) of findings that could affect adversely the safety of subjects, the conduct of the trial, or alter the IRB's approval to continue the study

Case Discussions

- It's one thing to read the ICH GCP guidance. It's another thing entirely to be able to relate formal GCP guidance to how it's specifically applied "on the ground" in research studies.
- We will present a few cases for group discussion, including some details of the case and prompts to get the conversation going. We will also affiliate the cases with the regulatory references.
- The cases can help to **CONNECT** the requirements of GCP with study conduct.
- Contribute to the conversation by unmuting and/or Zoom Chat.

1) The case of “who done it”

The case

- During a QA review it was noted that the eligibility worksheets did not include the PI signature and date.
- Upon further review the QA reviewers noted initials were present on the eligibility worksheet, but the PI and research coordinator have the same initials.

The prompts

- What could the PI and research team have done to make it clearer who was documenting eligibility?
- What documents would capture information about this responsibility and cover attributability?
- What important information is missing on the eligibility worksheet?

Comments from Workshop Discussion

- *What could the PI and research team have done to make it clearer who was documenting eligibility?*
 - Use middle initials
 - Have separate signature lines on the CRFs
 - Line to print name
 - Specify that a signature from PI is required on the source
- *What documents would capture information about this responsibility and cover attributability?*
 - Delegation log
 - Our eligibility worksheets require the coordinator and investigator to write both their printed name and full signature
- *What important information is missing on the eligibility worksheet?*
 - The date it was assessed

Regulatory References for The case of “who done it”

- ICH GCP E6(R2) 4.9.0. The investigator/institution should maintain adequate and accurate source documents and trial records that include all pertinent observations on each of the site’s trial subjects. **Source data should be attributable, legible, contemporaneous, original, accurate, and complete.** Changes to source data should be traceable, should not obscure the original entry, and should be explained if necessary (e.g., via an audit trail).
- ICH GCP E6 (R2) 4.1.5 The investigator should maintain a list of appropriately qualified persons to whom the investigator has delegated significant trial-related duties.

2) The case of the outdated consent form

The case

- Alcohol dosing and response study testing young adults and competence on mental acuity tests, judgment, and simulated driving
- An amendment was approved to increase the alcohol dosing
- On self-audit the study team found that they had not implemented the updated IRB approved consent form.
- 40 subjects consented on consent forms that described lesser alcohol dosing amounts.

The prompts

- What human protections issue do you see here?
- What should the study team do, if anything, to correct the problem?
- What could have prevented this problem from occurring in the first place?

Comments from Workshop Discussion

- *What could have prevented this problem from occurring in the first place?*
 - I try to not make up a bunch of consent forms in advance so the wrong versions aren't floating around
 - Only take the consent form from the IRB-approved source / only get blank consents from the "system of truth" IRB system / only consent on ICF pulled from IRB the DAY of consent. Always use the correct version
 - Make sure you are using the most recent stamped document / Always confirm you have the most recent IRB approved consent form prior to consenting each participant
 - A list of current consents and approval dates to refer to before consenting
 - Staff should be trained on where to retrieve the most up to date approved ICF and avoid accidentally using an old one / Informed Consent training
 - Any time a new protocol goes into effect, be sure to inform and discuss with all involved in the study
 - Habitual verification of the ICF version prior to printing/signing
 - A good ICF log (who signed what version) can be helpful
 - Make sure the eConsent is updated
 - Submit a major deviation to the IRB and provide a plan to fix the issue and how to avoid it in the future
- *What human protections issue do you see here?*
 - Major protocol deviations
 - Re-consent was likely required
 - There is a problem with safety
 - Increased risk to subject
 - This would not represent fully informed consent
- *What should the study team do, if anything, to correct the problem?*
 - Should have updated the consent forms and re-sent to all participants who signed the old form
 - Inform PI

Regulatory References for The case of the outdated consent form

- ICH GCP E6(R2) 4.8.10: Informed consent of trial subjects
- ICH GCP E6(R2) 4.8.10(c): Both the informed consent discussion and the written informed consent form and any other written information to be provided to subjects should include explanations of the following: the trial treatments
- OHRP 45 CFR 46.116(a)(4):

The prospective subject or the legally authorized representative must be provided with the information that a reasonable person would want to have in order to make an informed decision about whether to participate, and an opportunity to discuss that information.

3) The case of the changing protocol

The case

- A study is testing a new drug infusion to decrease long-term effects of ischemic stroke.
- The protocol requires a particular neuro assessment score be obtained in-person by a certified investigator at study baseline assessment.
- After the first few participants, the study coordinator began to use the most recent neuro assessment score from the medical record (done per usual care) to complete the Case Report Form. This practice continued and new RAs were trained to this practice.

The prompts

- What do you think of this change in the protocol?
- What ramifications if any could it have... for subject safety? For data quality?
- What should be done here?

Comments from Workshop Discussion

- *What do you think of this change in the protocol?*
 - Protocol change would lead to inconsistent data
 - Staff cannot make changes!
 - Staff cannot administer an assessment required of the investigator
- *What ramifications if any could it have... for subject safety?...for data quality?*
 - Is a protocol deviation if not done by delegated staff, and potentially not usable data if protocol doesn't allow for pre-consent data
 - Subject safety is at risk! Increased risk given that they are relying on data not obtained at the time of the study visit for the particular safety check
 - QA checks were likely not performed by study team either
- *What should be done here?*
 - Report deviation
 - Staff should not be conducting the assessment since it is supposed to be a CERTIFIED investigator
 - Report to IRB, re-train staff

Regulatory References for The case of the changing protocol

- ICH GCP E6(R2) 4.5.1: The investigator should conduct the trial in compliance with the protocol which was given approval by the IRB
- ICH GCP E6(R2) 4.5.2: The investigator should not implement any deviation from, or changes of, the protocol without agreement by the sponsor and prior review and documented approval from the IRB of an amendment
- FDA 21 CFR 312.60: An investigator is responsible for ensuring that an investigation is conducted according to the signed investigator statement, the investigational plan, and applicable regulations; for protecting the rights, safety, and welfare of subjects under the investigator's care...

4) The case of operationalizing screening and consent

The case

- The study is enrolling females age 16-45. Subjects will receive a new vaccination which is FDA-approved, but the new dosing schedule will be tested: 2 doses (experimental dosing) vs 3 doses (FDA-approved dosing).
 - Inclusion criteria: age 16-45; patient at SuperCity Hospital; Not yet received vaccine; afebrile 24 hours before injection
 - Exclusion criteria: pregnant/nursing, allergy to yeast, immunocompromised (treatment within the last 30 days); coagulation disorder

The prompts

- What are some considerations on
1) consent and
2) screening
that the study team should take into account and develop processes for prior to enrolling?

Regulatory References for The case of operationalizing screening and consent

- ICH GCP 1.61: Vulnerable subjects
- ICH GCP 4.8: Informed Consent of trial subjects (specifically, 4.8.12)
- ICH GCP E6(R2) 4.5.1: The investigator should conduct the trial in compliance with the protocol which was given approval by the IRB
- FDA 21 CFR 50.55: Requirements for permission by parents or guardians and for assent by children
- FDA 21 CFR 50.52: Clinical investigations involving greater than minimal risk but presenting the prospect of direct benefit to individual subjects
- FDA 21 CFR 312.60: An investigator is responsible for ensuring that an investigation is conducted according to the signed investigator statement, the investigational plan...
- OHRP 45 CFR 46.116: General requirements for informed consent
- OHRP 45 CFR 46.108: Requirements for permission by parents or guardians and for assent by children

Comments from Workshop Discussion

- *What are some considerations on 1) consent and 2) screening that the study team should take into account and develop processes for prior to enrolling?*
 - Minor consent and parent consent in addition to the adult
 - Legal representative / LAR consent option
 - Screenings: verification of age, patient status, vaccine status, temperature check, pregnancy check, allergy check
 - Precise screening to cover all possible exclusion/inclusion criteria
 - Sexual activity screening for likelihood of an early, unidentified pregnancy
 - 2 days of screening 24-hours apart
 - May need to ask subjective questions like “in the last 24 hours have you experienced chills, sweating, etc.?”
 - A good checklist with documentation of how the answers were determined
 - Develop an inclusion/exclusion document in accordance with the protocol
 - Check with sponsor to expand on what they mean regarding immunocompromised status (what sort of treatment?)
 - How to check for coagulation disorder? Verified by patient report vs. PCP or study MD with physical exam?
 - Since they are a patient in the hospital already, can we review the records for some of these answers?

5) The case of forgotten consent document

The case

- Minimal risk study involving brief 1x intervention, surveys, data collection in a two-hour study visit
- IRB approved consent form/HIPAA authorization including signature lines for the subject and investigator
- The investigator didn't have a consent form and so instead explained the purpose, study procedures, risks, etc. and provided time to consider.
- The participant says they don't need anything in writing and agrees to participate.

The prompts

- What are the major issues here?
- Is it ok to continue with research activities with this participant?

Comments from Workshop Discussion

- *What are the major issues here?*
 - Need an ICF
 - Investigator should have known better, this is a big training problem
- *Is it ok to continue with research activities with this participant?*
 - No
 - Not okay. Need documentation or it did not happen.
 - Absolutely not. That is a participant safety issue
 - Remind them that you need to follow policies even if the participant doesn't feel they need anything in writing.
 - Research activities should not proceed. If so this is a protocol violation

Regulatory References for The case of the forgotten consent document

- ICH GCP E6(R2) 4.8.8 Prior to a subject's participation in the trial, the written informed consent form should be signed and personally dated by the subject or by the subject's legally acceptable representative, and by the person who conducted the informed consent discussion.
- ICH GCP E6(R2) 4.5.2: The investigator should not implement any deviation from, or changes of, the protocol without agreement by the sponsor and prior review and documented approval/favorable opinion from the IRB/IEC of an amendment
- ORHP 45 CFR 46.116 General Requirements for Informed Consent – specifically subsection B – basic elements of informed consent
- OHRP 45 CFR 46.117 Documentation of Informed Consent

6) The case of the operationalization of the safety monitoring plan

The case

- Study tests a new drug for treatment of COVID
- Hospitalized subjects receive investigational drug infusion daily for 5 days.
- Per the protocol subjects will be monitored for AEs throughout the hospital stay and then for 12 months after discharge.
- Any SAE (whether related or not or expected or not) should be reported to the Sponsor within 24 hours
- Other AEs should be reported via the data capture system within 60 days

The prompts

- How should AE monitoring procedures be operationalized for this study?
- What elements of study conduct relate to this case?
- What elements do you have to be sure to put in place to carry out this monitoring plan?

Comments from Workshop Discussion

- *How should AE monitoring procedures be operationalized for this study?*
 - Delegation log
 - Engagement of clinical team?
 - Making sure the participant is linked to the study in EPIC so the system pushes you a notification when they interact with the health care system
- *What elements do you have to be sure to put in place to carry out this monitoring plan?*
 - Review medical records and conduct check-ins on a regular basis
 - You should operationally define what “throughout the hospital stay” means – every few hours? Once per day? Etc.
 - Good procedures for following up with participants and documenting thoroughly
 - Thorough health history collected to differentiate pre-existing vs. AE
 - A heavily detailed MOP
 - Whoever is delegated in the log for reviewing AEs/SAEs should be approved in the IRB for that role
 - A procedure flowchart/checklist for what to do in each potential instance

Regulatory References for The case of the operationalization of the safety monitoring plan

- ICH GCP E6(R2) 4.11: Safety Reporting
- ICH GCP E6(R2) 4.1: Investigator Qualifications and Agreements
 - 4.1.1 The investigator(s) should be qualified by education, training, and experience to assume responsibility for the proper conduct of the trial
- ICH GCP E6(R2) 2.8: Each individual involved in conducting a trial should be qualified by education, training, and experience to perform his or her respective task(s).
- ICH GCP E6(R2) 4.9 Records and Reports
- FDA 21 CFR 312.64(b) Safety Reports
- FDA 21 CFR 312.53 Selecting Investigators and Monitors
- FDA 21 CFR 312.62(b) Investigator Recordkeeping and Record Retention

7) The case of a change in plans (Monitoring Plans)

The case

- Investigator Initiated Study, Local PI is the lead site, Investigator holds the IND, 10 participating sites
- The investigator/sponsor's FDA approved Monitoring Plan is to monitor all sites every three months.
- Due to budget constraints, the investigator decides only to monitor one third of the sites annually and as an additional cost savings, plans to conduct some of the monitoring visits personally.

The prompts

- What issues do you see with this change in monitoring plan?
- What steps that need to be taken before implementing these changes?

Regulatory References for

The case of The case of a change in plans

- ICH GCP E6(R2) 5.18.3. Extent and Nature of Monitoring

The sponsor should ensure that the trials are adequately monitored. The sponsor should determine the appropriate extent and nature of monitoring. The determination of the extent and nature of monitoring should be based on considerations such as the objective, purpose, design, complexity, blinding, size, and endpoints of the trial...

- ICH GCP E6(R2) 5.18.7 Monitoring Plan

The sponsor should develop a monitoring plan that is tailored to the specific human subject protection and data integrity risks of the trial. The plan should describe the monitoring strategy, the monitoring responsibilities of all the parties involved, the various monitoring methods to be used, and the rationale for their use...

8) The case of the memory regulatory file

The case

- 
- PI obtained biological samples (blood, saliva, tissue) from participants undergoing surgery.
 - On routine audit it was found there is no documentation of sample collection for research, such as date samples taken, from which participants, type of samples taken, etc.
 - PI states this information “lives in their memory.”

The prompts

- What is/are the issue(s) here?
- What ramifications, if any, could these processes have on the study?
- How can this be corrected?

Regulatory References for The case of the memory regulatory file

- ICH GCP E6(R2) 4.9.1 Research Records and Reports: The investigator/institution should maintain adequate and accurate source documents and trial records that include all pertinent observations on each of the site's trial subjects. Source data should be attributable, legible, contemporaneous, original, accurate, and complete. Changes to source data should be traceable, should not obscure the original entry, and should be explained if necessary...
- ICH GCP E6(R2) 8.0: Essential Documents
 - 8.1 Essential documents are those documents that individually and collectively permit evaluation of the conduct of a trial and the quality of the data produced ...

GCP – A Final Emphasis

- Compliance with this standard provides public assurance that.....
 - the rights, safety and well being of trial subjects are protected, consistent with the principles that have their origin in the Declaration of Helsinki,
 - and that the clinical trial data are credible.
