Heart Failure Common and Costly Condition

- Heart failure common condition with significant burden of disease¹
 - 5.7 million with condition
 - 1.1 million admissions (2006)
 - 292,000 annual deaths
 - \$37.2b annual direct and indirect cost

[1] AHA. Heart Disease and Stroke Statistics – 2009 Update.

Self-management training can be effective

- Self-management training programs have demonstrated
 - fewer hospitalizations
 - lower mortality
 - improved health-related quality of life
- Optimal program is unclear
 - dose?
 - mode?
 - population to target?

Self-management training programs

- Self-management training programs vary considerably, but often address
 - general HF knowledge,
 - salt knowledge,
 - self-care skills,
 - medication adherence, and
 - exercise

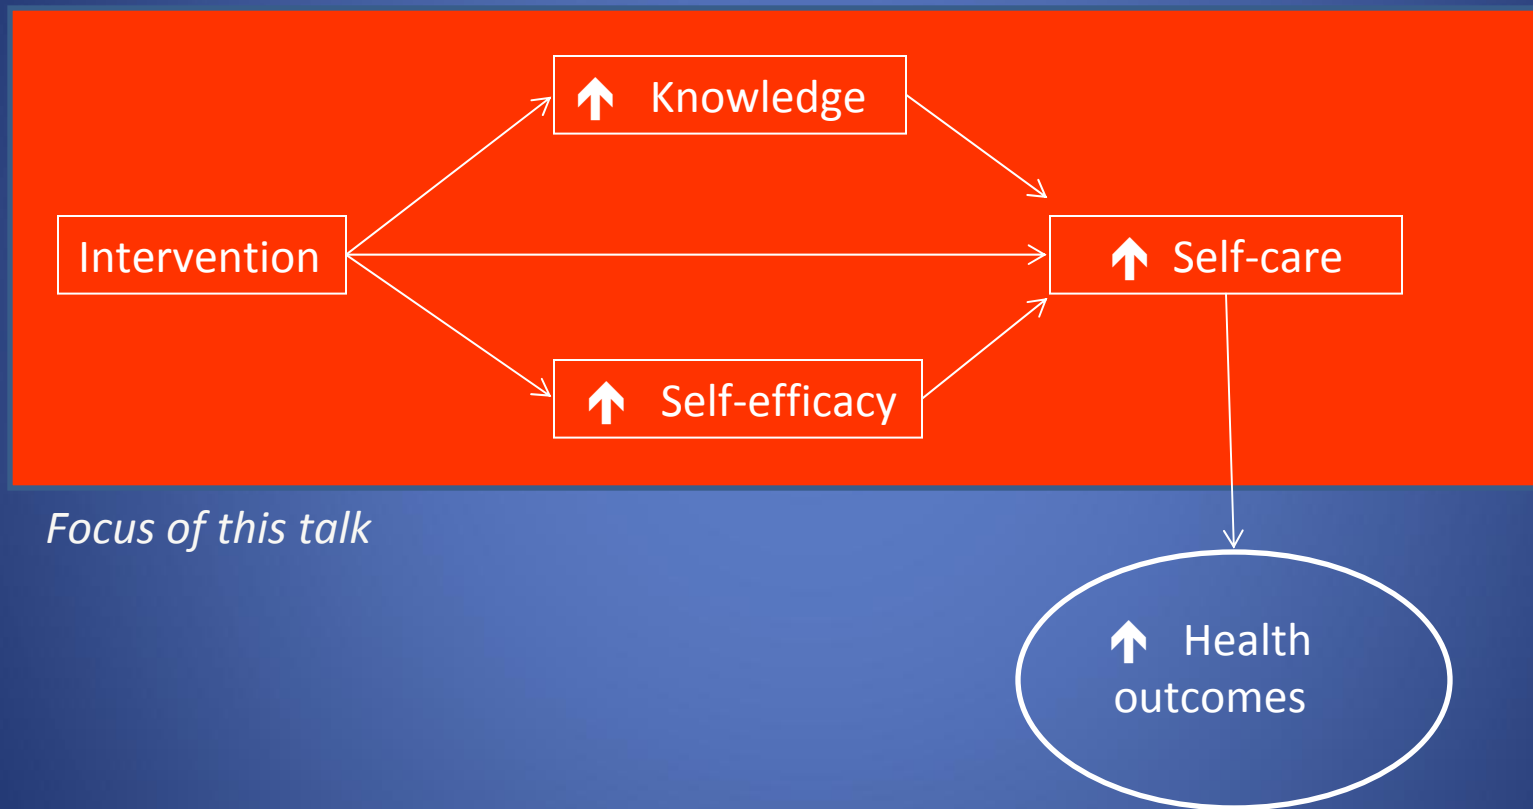

Patients with Low Literacy at Risk

- Low literacy confers risk for
 - all-cause mortality
 - all-cause hospitalization
 - heart failure hospitalization
- Well designed self-management training may mitigate the relationship between literacy and heart failure hospitalization^{1,2}
- Mixed evidence suggesting programs may be more effective among disadvantaged populations
- Whether the optimal amount of heart failure self-management training differs by literacy level is not known

²DeWalt et al. BMC HSR 2006; 6:30

Conceptual Model

Focus of this talk

Specific Aim

- To determine in a randomized trial whether those assigned a higher amount of self-management training had more durable improvements in self-management measures than those receiving a single session, and whether the durability varied by literacy

Single education session (~ 40 minutes)

Health Educator and Self-Management Guide

New Digital Scale

Randomization

Stratified by Literacy and Site

No further intervention

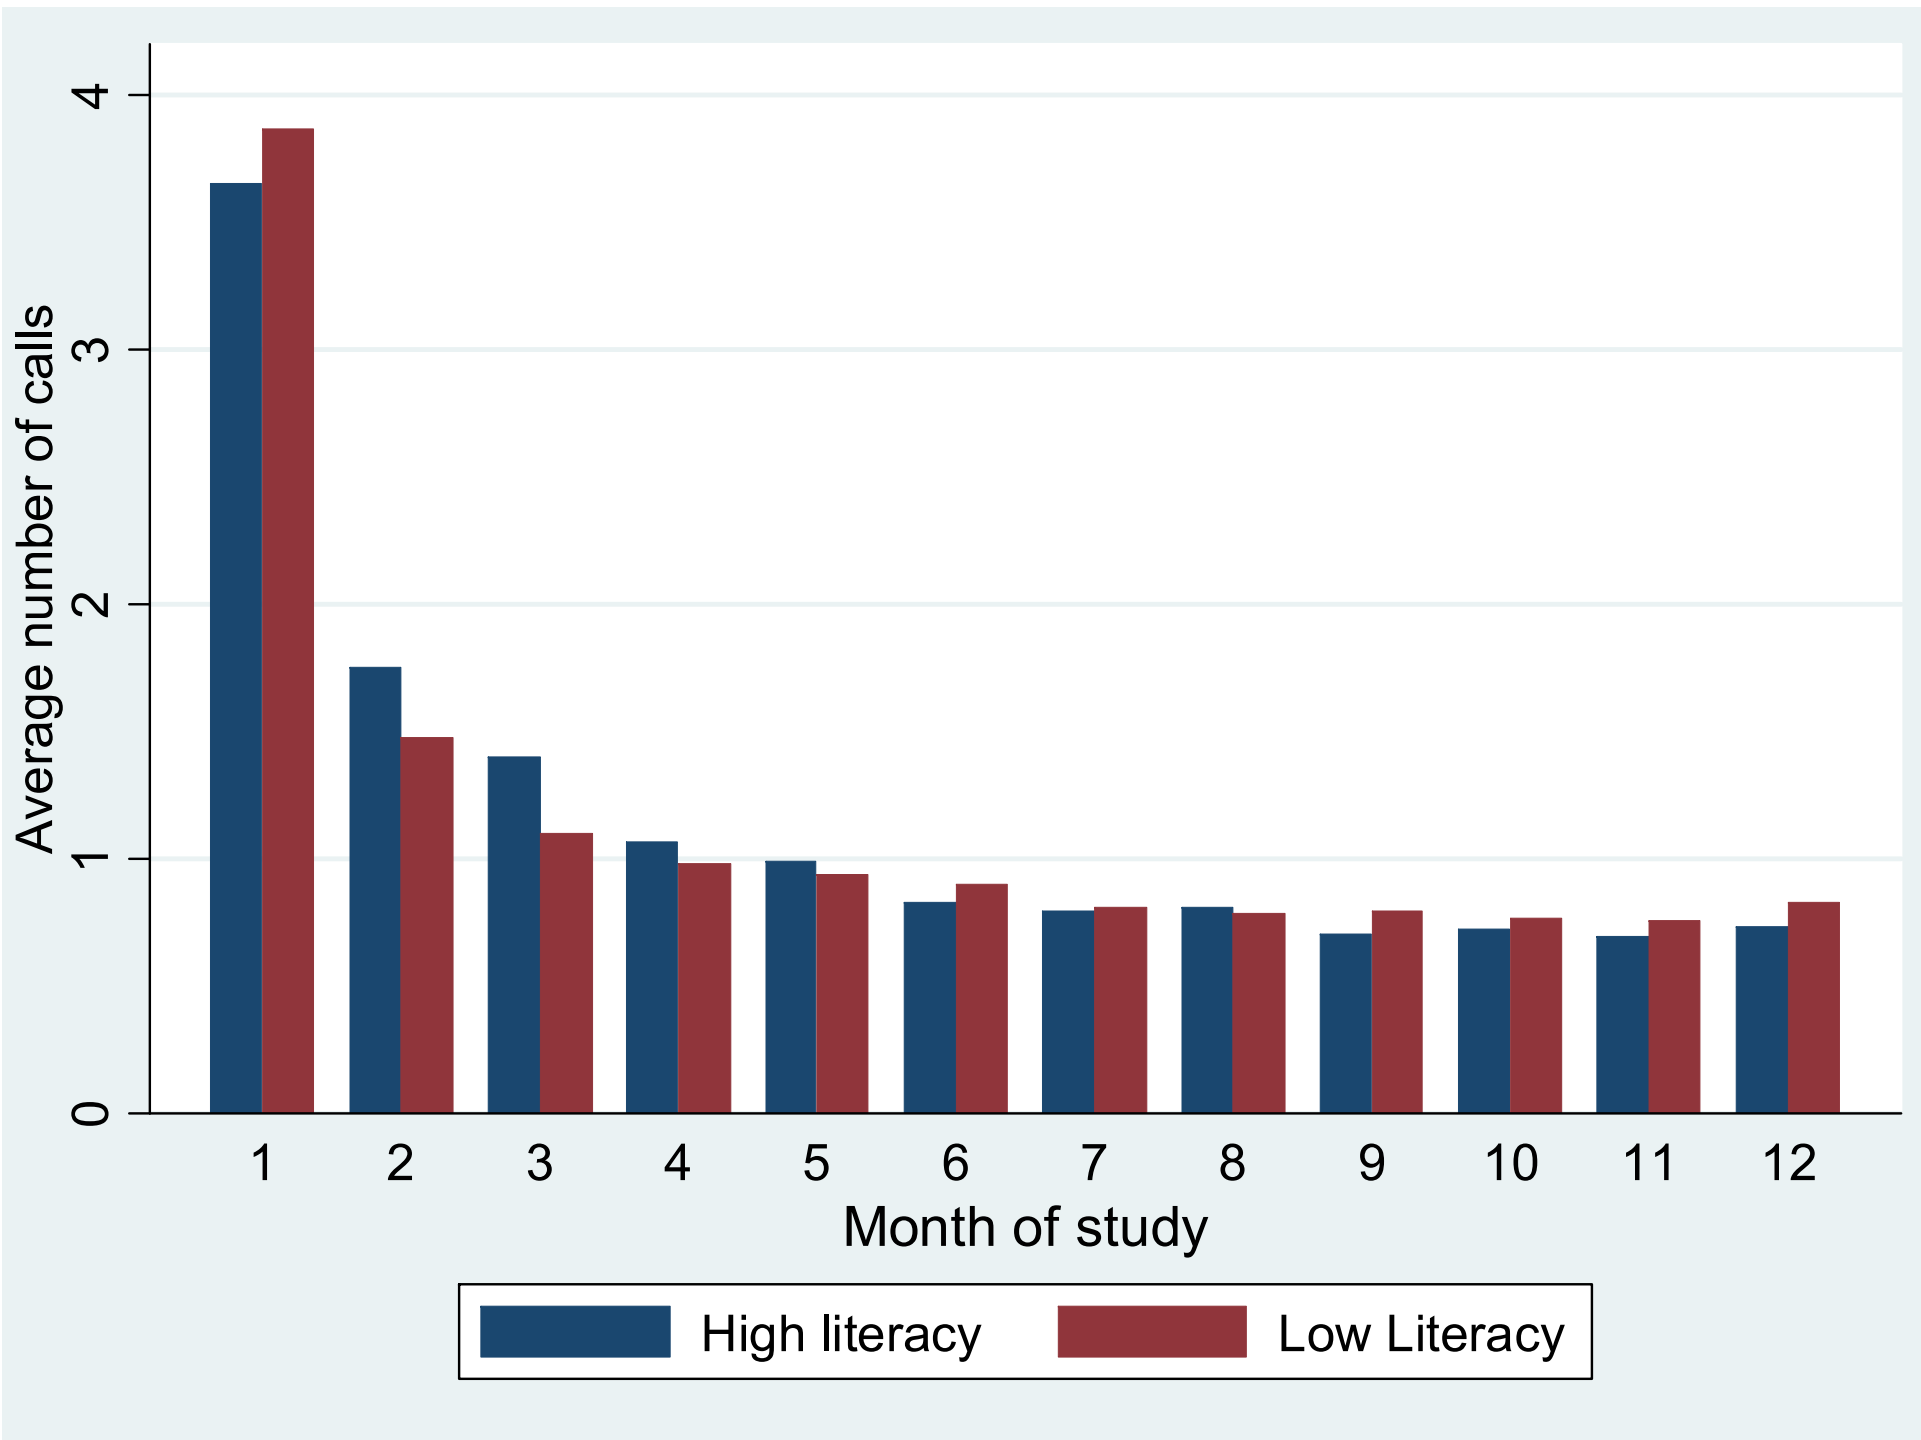

Single Session Only (SSO)

Additional Education

Multi-session (MS)

Intervention design

- Intervention was designed as “teach to mastery”
 - Delivered telephonically by trained health educators
 - More calls in the beginning of the study period, tapered off over time
 - Median number of calls was 14.2 and did not vary by literacy level
 - 3.8 calls in first month, 1.1 per month in next 5 months, and .8 calls per month in the last 6

Study Sites and Eligibility

- Study Sites – 4 medical centers
 - University of North Carolina at Chapel Hill
 - Feinberg School of Medicine, Northwestern
 - UC San Francisco, San Francisco General Hospital
 - Olive View-UCLA Medical Center
- Eligibility criteria (N=605)
 - Clinical diagnosis of HF, ≥ 1 supportive test result
 - Symptomatic HF (NYHA II-IV) in the past 6 months
 - Current use of a loop diuretic
 - Fluent in English or Spanish
 - Literacy assessed by s-TOFHLA: Inadequate & Marginal = “Low literacy”,
n = 225 (37%)

Outcomes

- General HF Knowledge¹ (8 items, $\alpha=.66$)
 - “What is heart failure?”
- Salt Knowledge¹ (10 items, $\alpha=.36$)
 - “Do hot dogs have a lot of salt?”
- Self-efficacy² (10 items, $\alpha=.73$)
 - “How sure are you that you know when body has too much or too little fluid?”
- Self-care (10 items, $\alpha=.55$)
 - “How often do you weigh yourself?”

Blinded measurement at baseline, 1, 6, 12 months

- 1 month improvement already identified³

¹ Baker et al. *J Cardiac Failure*. 2005. ² DeWalt et al. *BMC HSR*. 2009. ³ Baker et al. *J Cardiac Failure*. 2011

Method

- Generalized Estimating Equations account for repeated measures
 - “Fully saturated” models: study arm X time X literacy = $2 * 4 * 2 = 16$ variables
 - Parsimonious models developed by testing interactions

Participant Sociodemographics

	Single Session Only (N=302)		Multi-session (N=303)		p
Age, mean \pm SD	60.3	\pm 12.3	61.1	\pm 13.8	0.49
Race/Ethnicity, N (%)					0.73
White, non-Hispanic	122	(40)	111	(37)	
African American	114	(38)	118	(39)	
Hispanic	43	(14)	54	(18)	
Male, N (%)	156	(52)	158	(52)	0.90
Language: English, N (%)	261	(88)	261	(87)	0.67
Low Literacy, N (%)	112	(37)	113	(37)	0.96
< 12 yrs education, N (%)	78	(26)	82	(27)	0.73
Subjective Social Status, mean \pm SD (Range 1-10)	5.0	\pm 2.4	4.6	\pm 2.6	0.02

Salt Knowledge Inadequate Literacy

Salt Knowledge Adequate Literacy

Statistical results

- Differences at six and twelve months were no different than differences at one month
- Measures were higher in months one, six, and twelve among those receiving multiple sessions
- Differences in study arm were typically independent of patient literacy

Conclusions

- Those receiving multiple self-management training sessions had higher knowledge, salt knowledge, self-care, and self-efficacy.
 - Differences from baseline to 1 month were preserved at 6 and 12 month outcomes
- No evidence that effect of intervention dose varied by literacy

Limitations

- Salt and self-care are not unidimensional scales
- Measured outcomes are intermediate outcomes , not clinical
- Dose delivered not as “teach to mastery” as we had intended
 - Did not differ by literacy

Implications

- Multiple self-management training sessions led to more improvement and greater durability in improvement
- Matching training to need needs more refinement in order to reduce literacy-related differences in outcomes
- Patients with low literacy improved by similar amounts as high literacy patient for the given training, suggesting that they can learn self-management skills just as well if given the opportunity.
