"Aced" the MOCA.

"Flunked" the MOCA

TESTING TESTING

Creator of cognition test Trump brags of acing says it's 'supposed to be easy' for unimpaired people

July 21, 2020

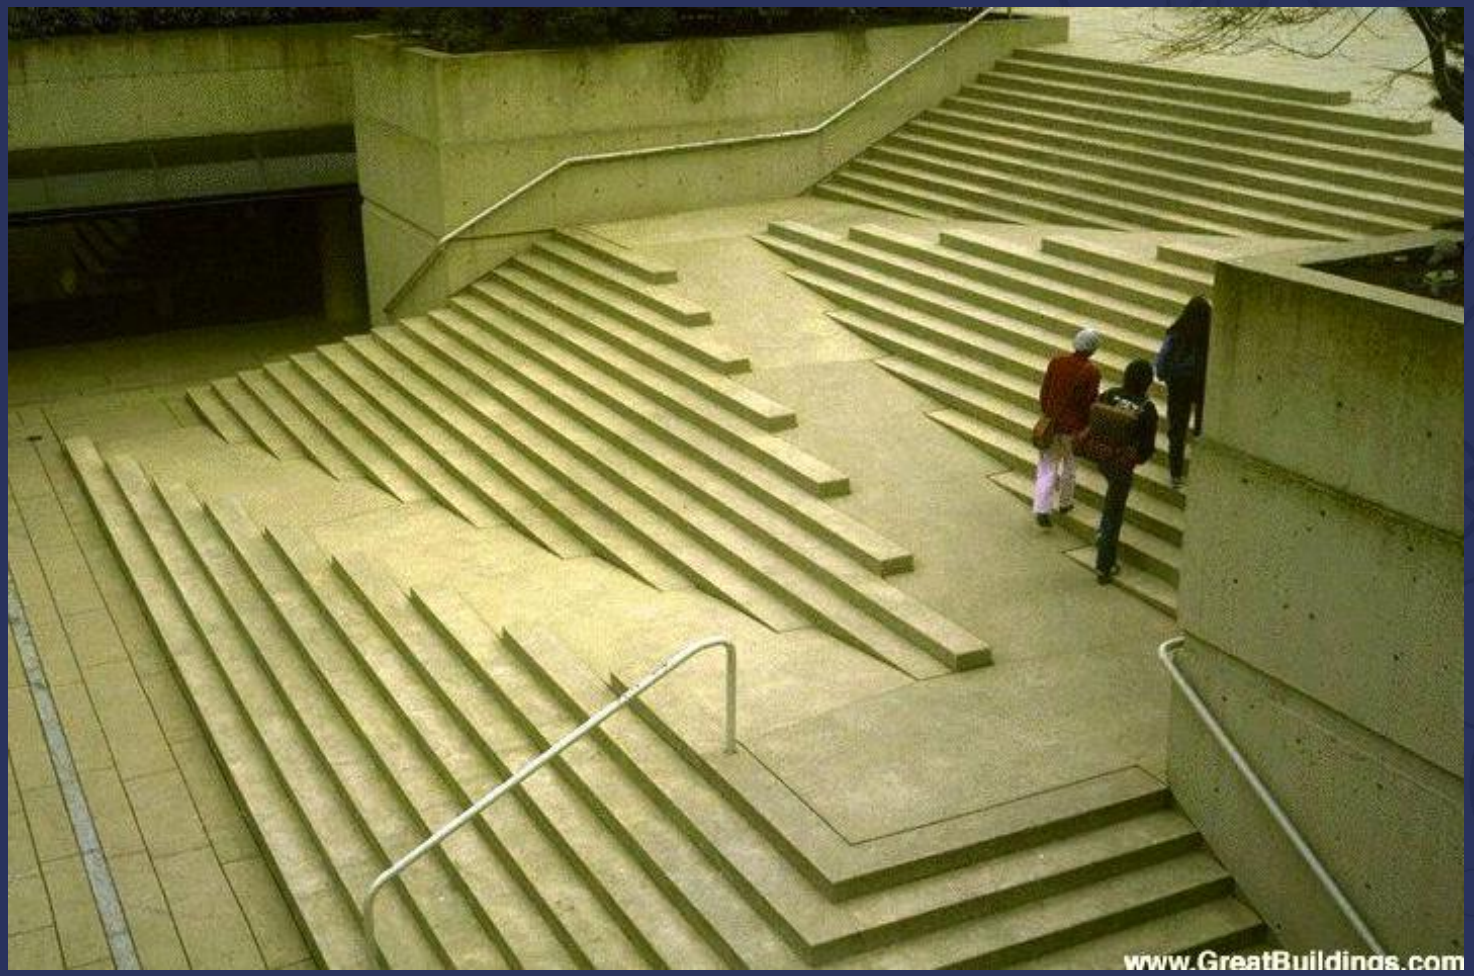
President Trump told Fox News host Sean Hannity earlier in July that he "aced" a cognitive test at Walter Reed Medical Center "very recently," and Fox News anchor Chris Wallace did not seem overly impressed when Trump brought up the test again during his *Fox News Sunday* interview over the weekend. Wallace said he also took the Montreal Cognitive Assessment (MoCA) test after Trump said he passed it, and "it's not the hardest test. It shows a picture and it says, 'what's that,' and it's an elephant."

Universal Design for Learning

Some people face more barriers than others

Retrofitting is highly problematic

Universal Design



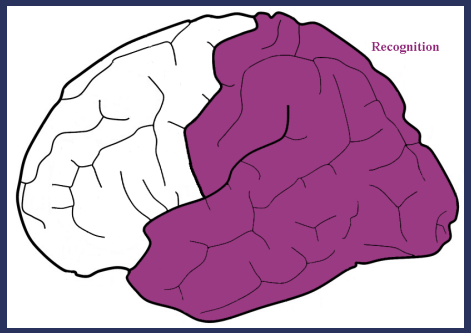
...better for Everyone

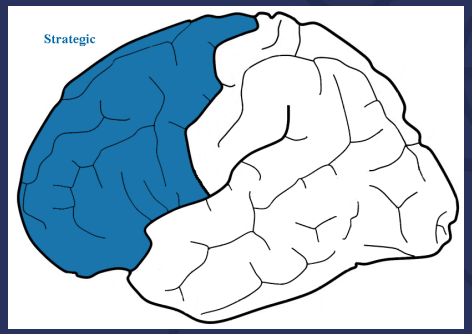
But careful design matters

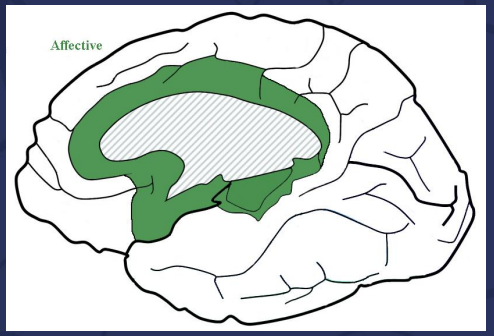
But what is Universal Design for Learning?

Universal Design for Learning

A research-based framework for identifying individual differences in learning

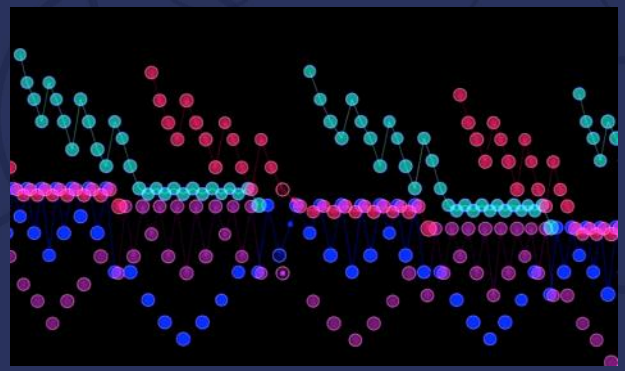






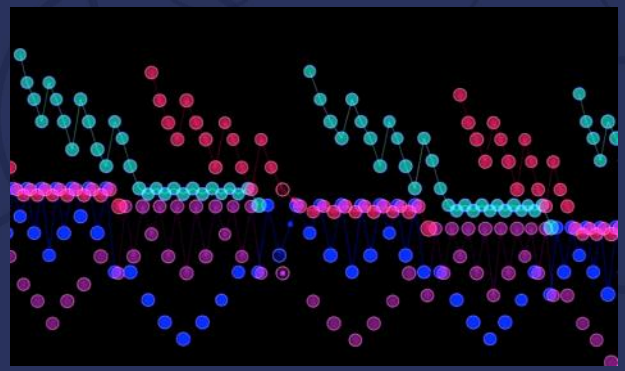
..and designing learning activities that meet the challenge of diversity

I. Provide Multiple Means of Representation	II. Provide Multiple Means of Action and Expression	III. Provide Multiple Means of Engagement
Perception	Physical action	Recruiting interest
Language, expressions, and symbols	Expression and communication	Sustaining effort and persistence
Comprehension	Executive function	Self-regulation

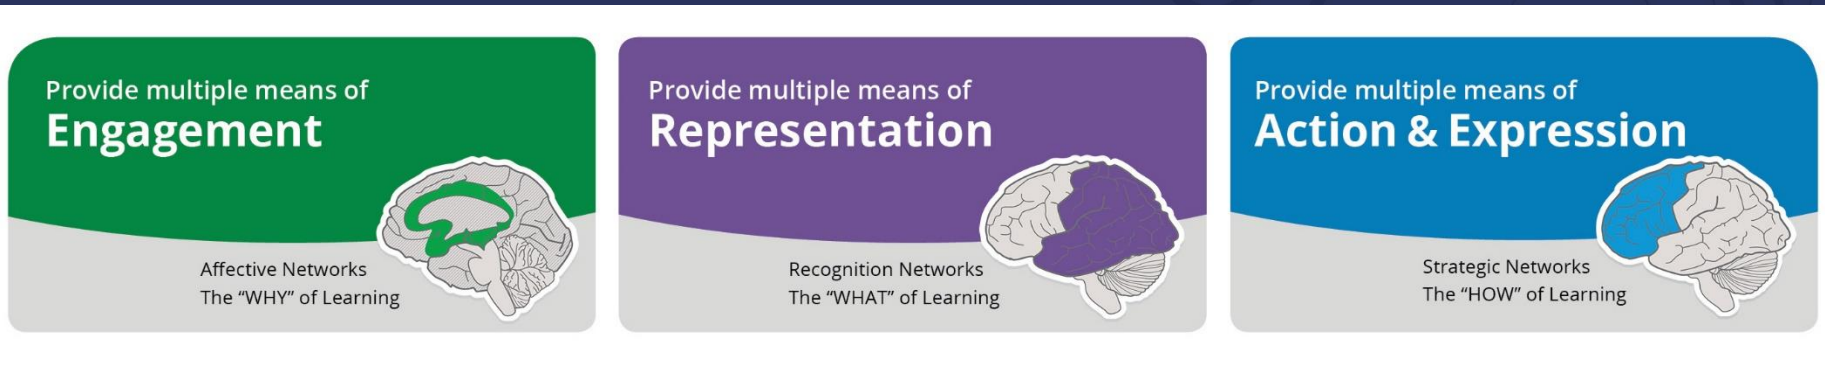


by reducing barriers for some and increasing options for all

I. Provide Multiple Means of Representation	II. Provide Multiple Means of Action and Expression	III. Provide Multiple Means of Engagement
Perception	Physical action	Recruiting interest
Language, expressions, and symbols	Expression and communication	Sustaining effort and persistence
Comprehension	Executive function	Self-regulation



3 Principles of UDL



Necessary for *some*, good for *all*

Universal Design for Learning Guidelines

Provide Multiple Means of Engagement

Purposeful, motivated learners

Provide options for self-regulation
- Promote expectations and beliefs that optimize motivation
- Facilitate personal coping skills and strategies
- Develop self-assessment and reflection

Provide options for sustaining effort and persistence
- Heighten salience of goals and objectives
- Vary demands and resources to optimize challenge
- Foster collaboration and community
- Increase mastery-oriented feedback

Provide options for recruiting interest
- Optimize individual choice and autonomy
- Optimize relevance, value, and authenticity
- Minimize threats and distractions

Provide Multiple Means of Representation

Resourceful, knowledgeable learners

Provide options for comprehension
- Activate or supply background knowledge
- Highlight patterns, critical features, big ideas, and relationships
- Guide information processing, visualization, and manipulation
- Maximize transfer and generalization

Provide options for language, mathematical expressions, and symbols
- Clarify vocabulary and symbols
- Clarify syntax and structure
- Support decoding of text, mathematical notation, and symbols
- Promote understanding across languages
- Illustrate through multiple media

Provide options for perception
- Offer ways of customizing the display of information
- Offer alternatives for auditory information
- Offer alternatives for visual information

Provide Multiple Means of Action & Expression

Strategic, goal-directed learners

Provide options for executive functions
- Guide appropriate goal-setting
- Support planning and strategy development
- Enhance capacity for monitoring progress

Provide options for expression and communication
- Use multiple media for communication
- Use multiple tools for construction and composition
- Build fluencies with graduated levels of support for practice and performance

Provide options for physical action
- Vary the methods for response and navigation
- Optimize access to tools and assistive technologies

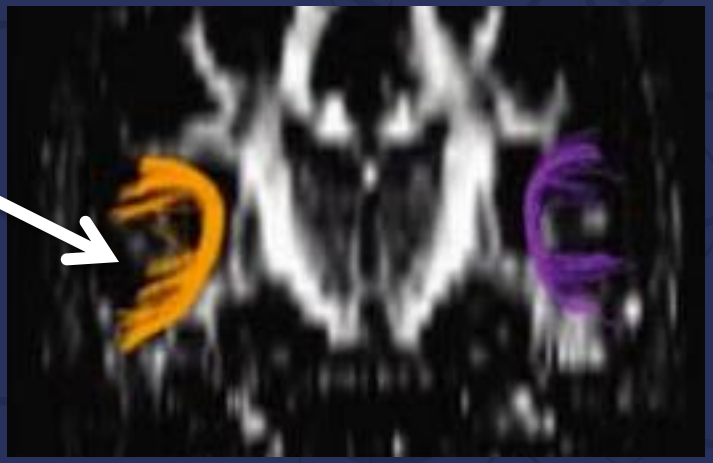
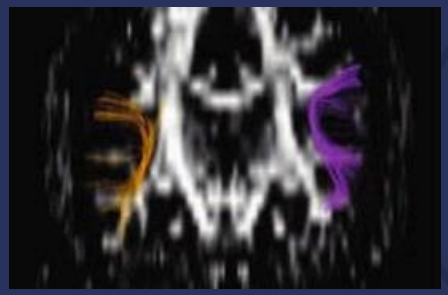
42



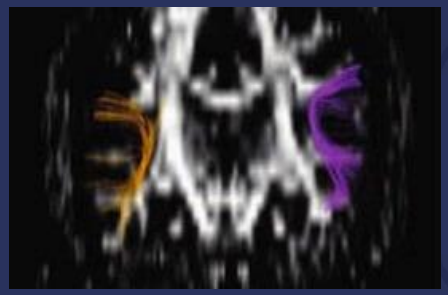
David vs Ruth



David is “hypo-connected”

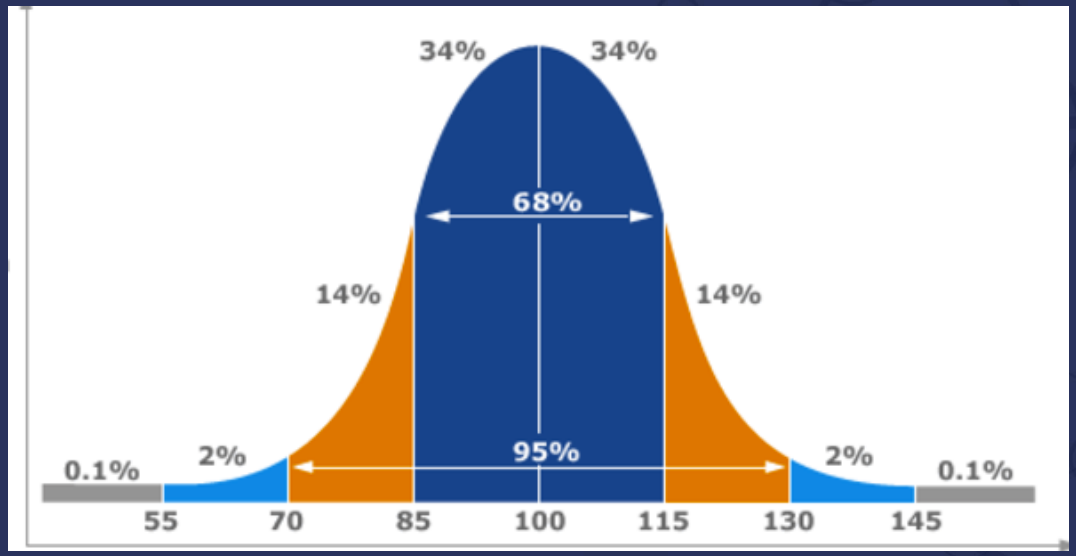
Ruth is “hyper-connected”

Who has a ”disability”?

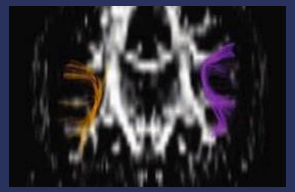


It depends……

Actually, we're both on a Spectrum

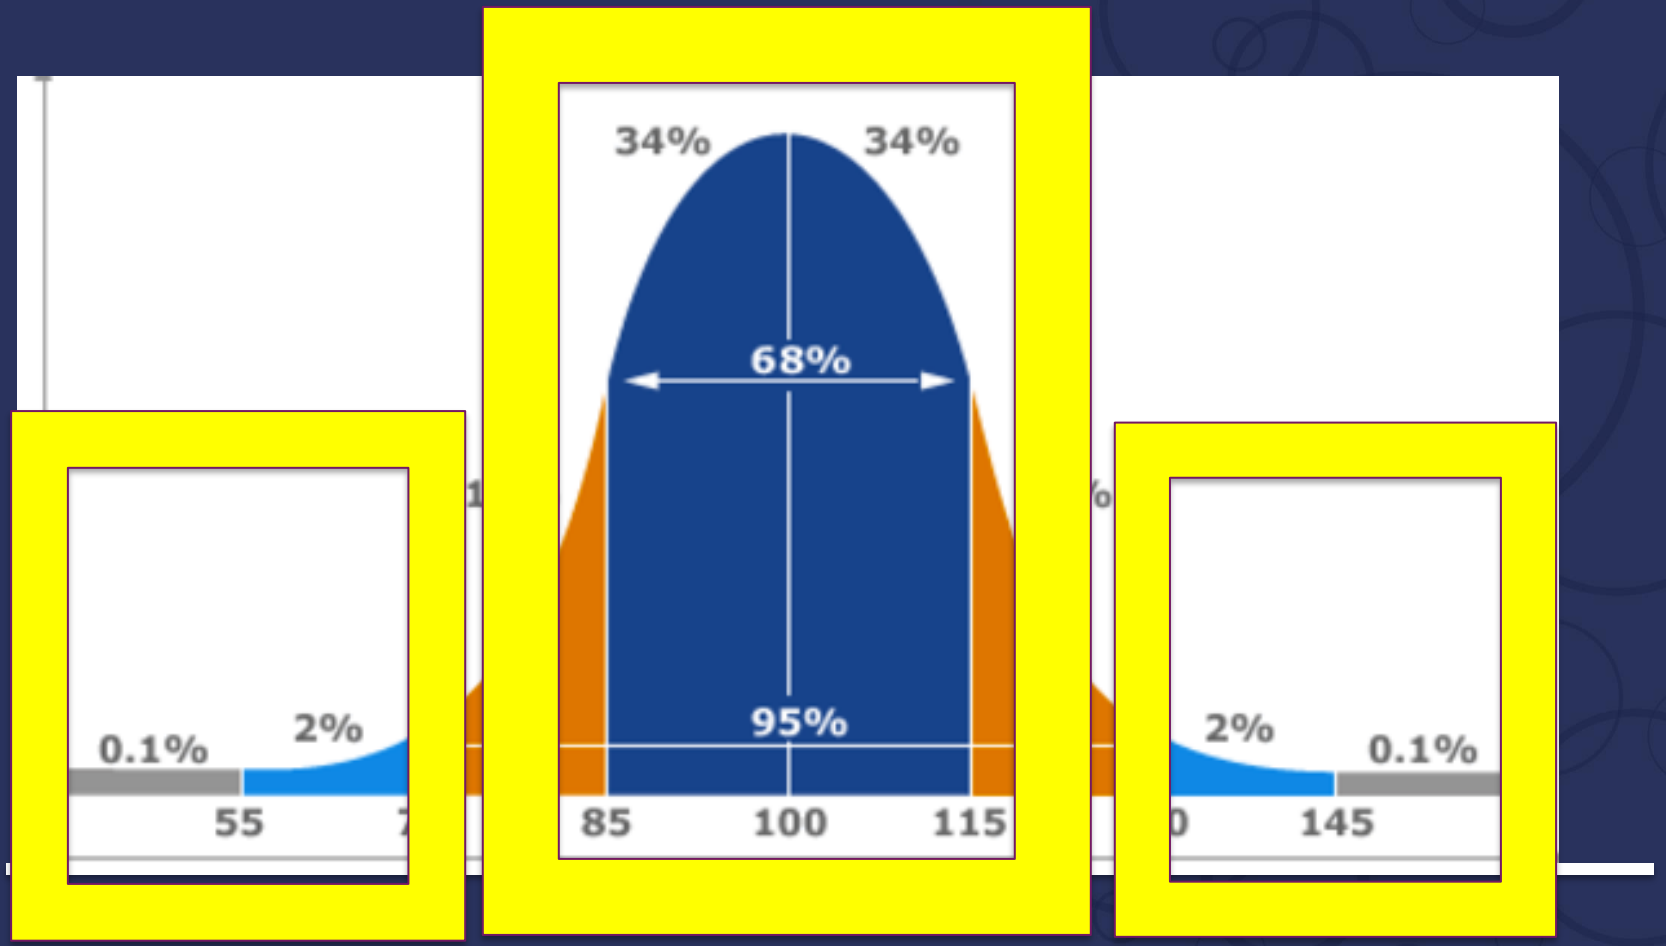


Hypo-acuity of pitch



Hyper-acuity of pitch

But the culture sees categories..



Defective
Disabled

Regular
Average

Gifted
Genius

What determines where each of us are on the spectrum?

Biology Matters

1) Neuroanatomy Matters
2) Phylogeny Matters
3) Genes Matter

What determines where each of us are on the spectrum?

Biology Matters

1) Neuroanatomy Matters
2) Phylogeny Matters
3) Genes Matter

Environment Matters

4) Culture Matters
5) Language Matters
6) Instruction Matters
7) Timing Matters
8) Technology Matters
9) Context Matters

Both Biology and Environment determine the cut-off for disability, abnormality

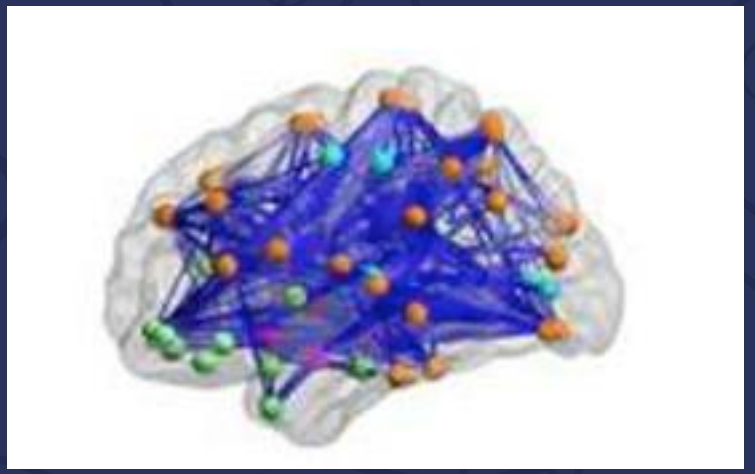
Hypo-connectivity



Hyper-connectivity

What determines where each of us is on the "autism" spectrum?

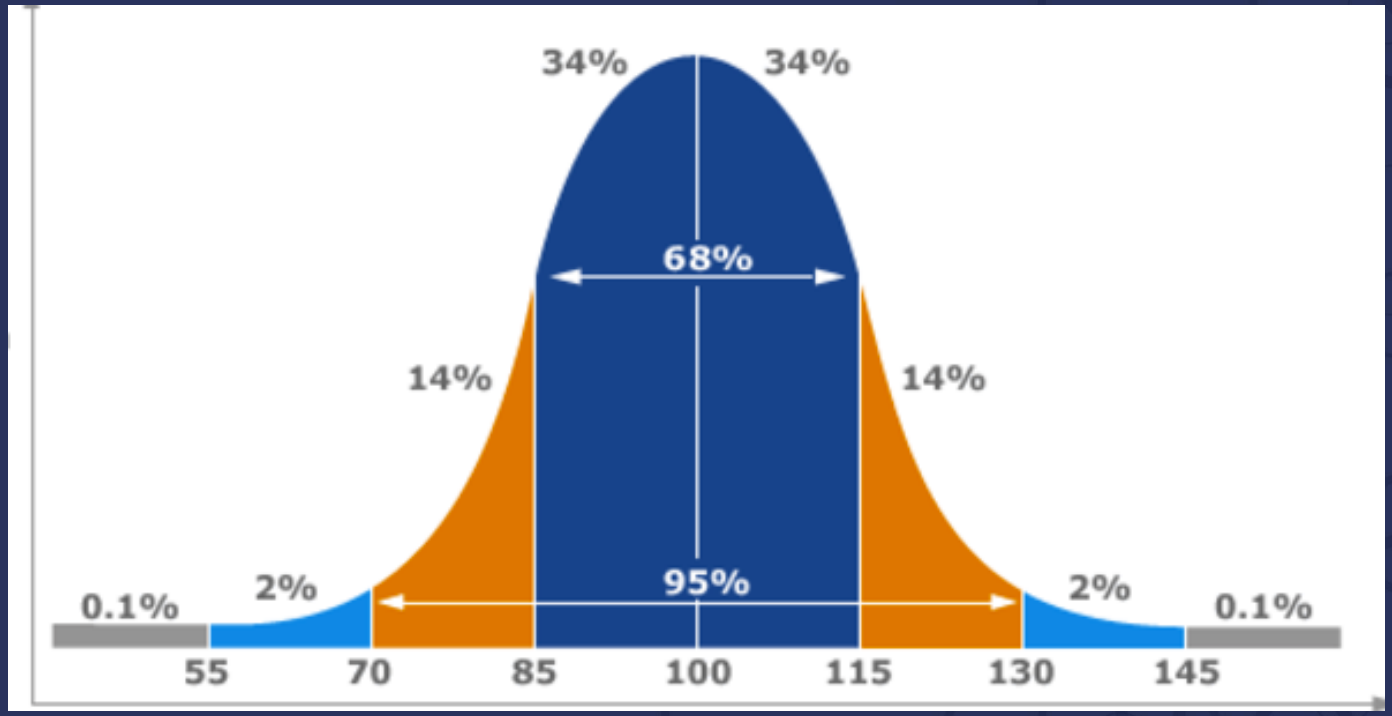
Biology Matters

1) Neuroanatomy Matters
2) Phylogeny Matters
3) Genes Matter

Environment Matters

4) Culture Matters
5) Language Matters
6) Instruction Matters
7) Timing Matters
8) Technology Matters
9) Context Matters

Where am I on the autism Spectrum?

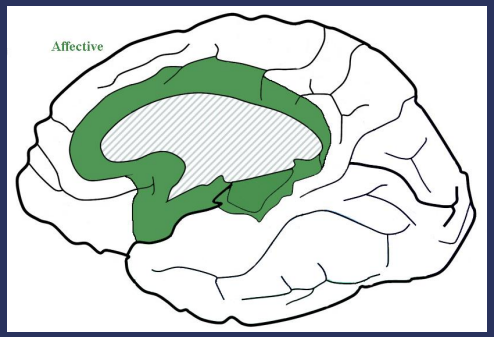


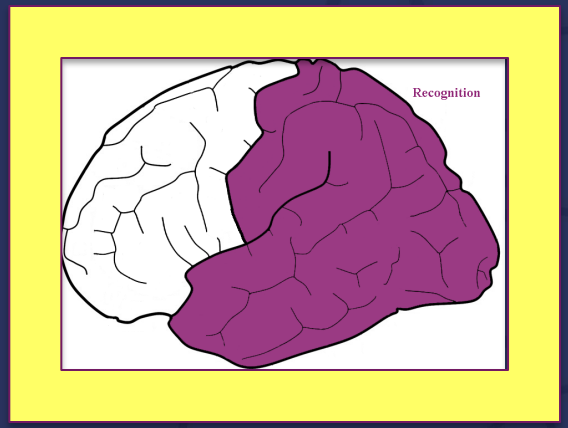
It depends……

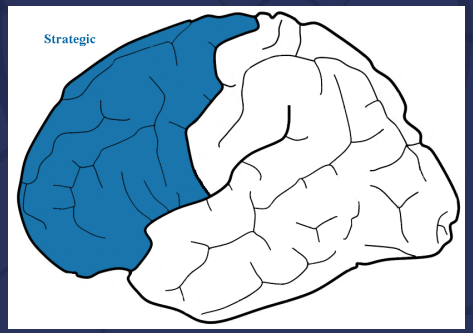
I am on the Spectrum,

And so are you.

Where did the three principles come from?

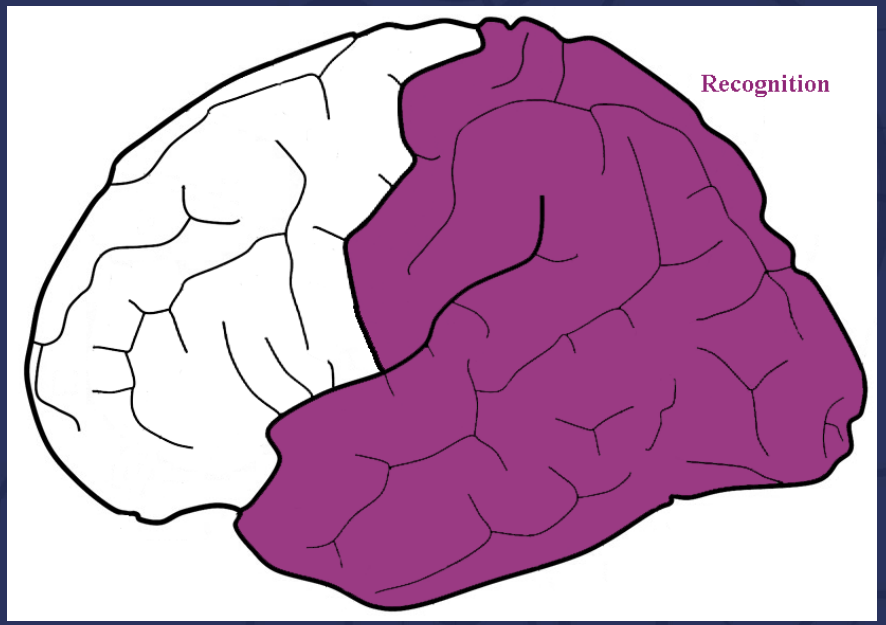




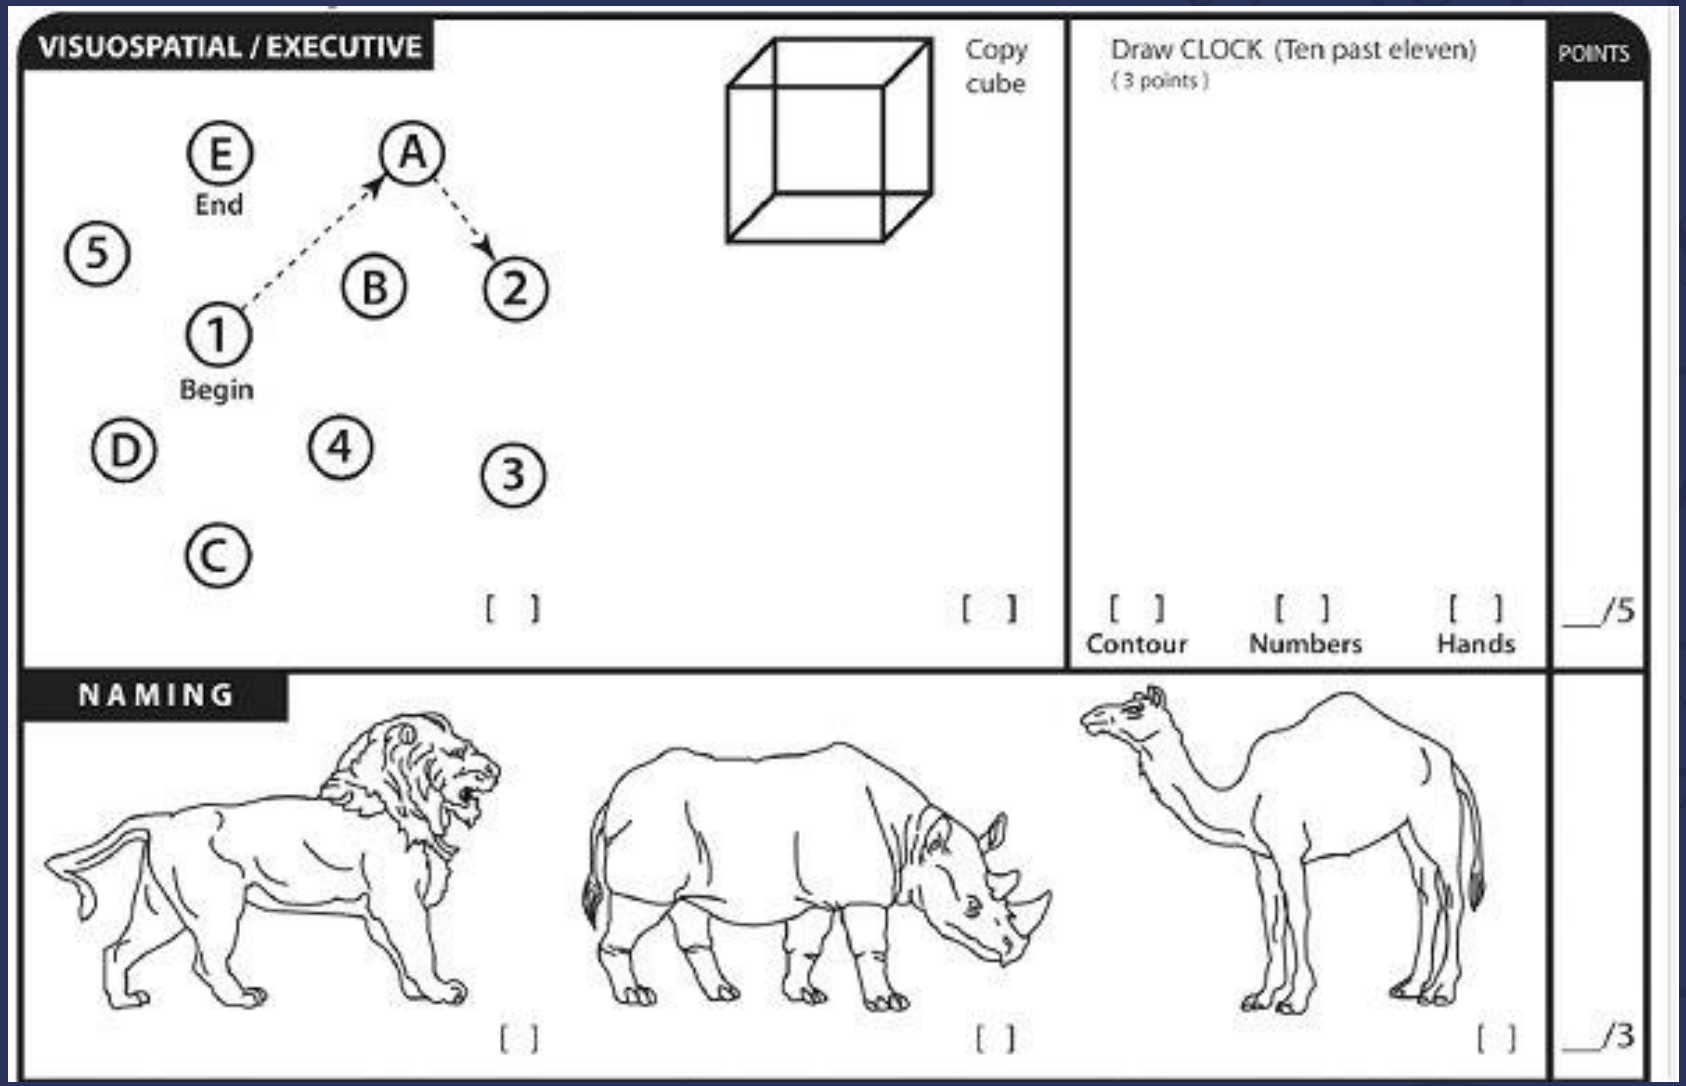


Recognition Networks
What's that?

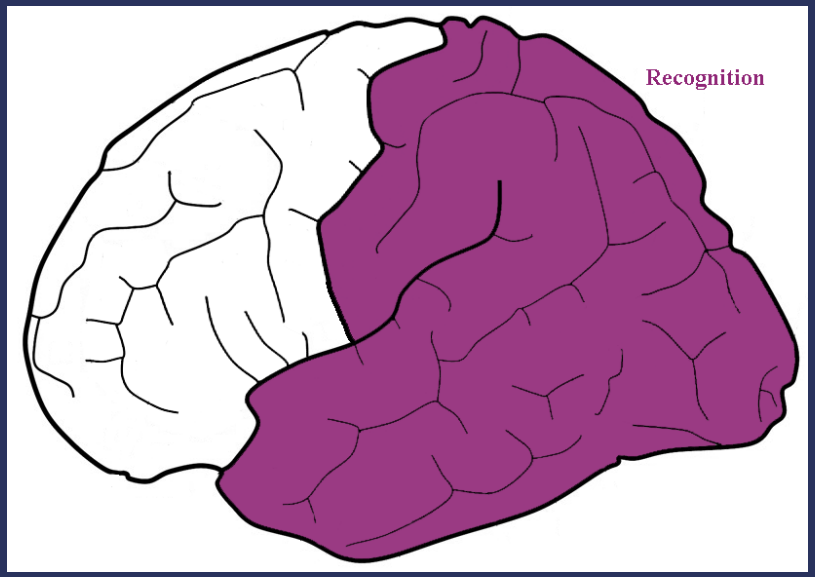
Perceive,
understand,
and remember
information from
the environment

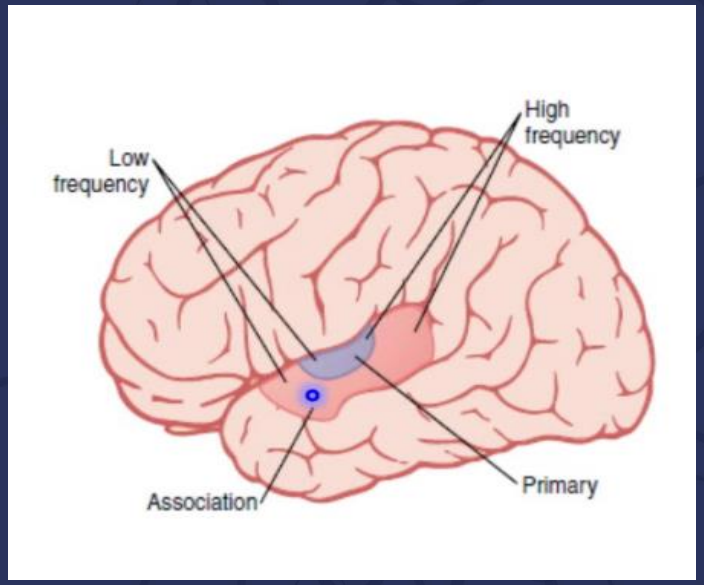


Recognition on the MOCA

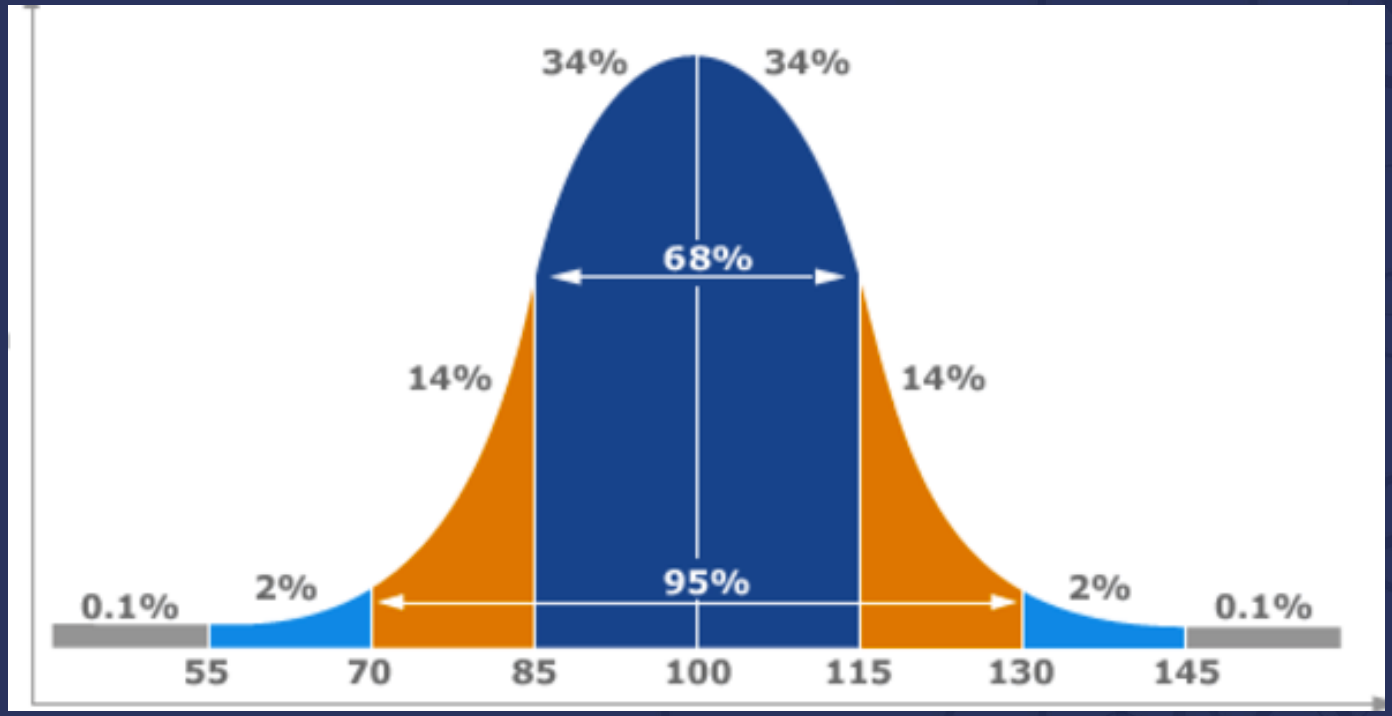


Where does recognizing sound happen?





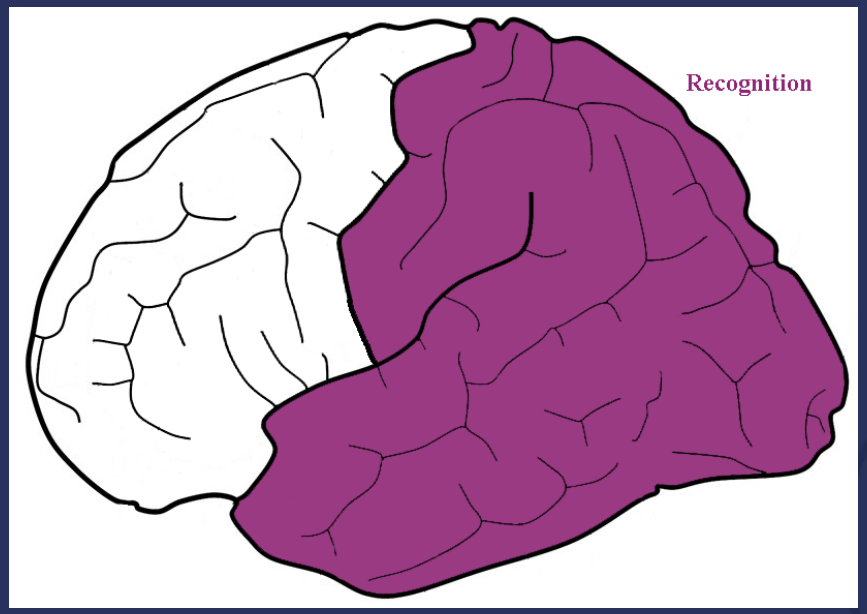
Where am I on the hearing spectrum?



It depends……

Aging has changed where I am on the spectrum

New Barriers to Learning: 1) hearing



- NEUROLOGICAL EXAM
  MS: His language was fluent but slightly slow and hesitant. He scored a 25 out of 30 on the MOCA losing 1.4 trails, digit span back and 3 points for delayed recall. He named 12 words beginning with F, 16 animals with one repetition. Boston naming was 15 out of 15. On the I Boca he was 5 out of 5 on the visual association recall and recognition.
  CN: EOMI, PERRL, VFFTC, Face symmetrical. Tongue and uvula midline. Hearing intact.
  MOTOR: No drift. No adventitious movements. FFM and RAM are rapid. Full power throughout.
  SENSORY: Intact to LT
  DTR: Symmetrical throughout. Plantars are downgoing.
  COORDINATION: FFM, RAM, dysmetria, dysdidokokinesia.
  GAIT: Narrow based and steady.

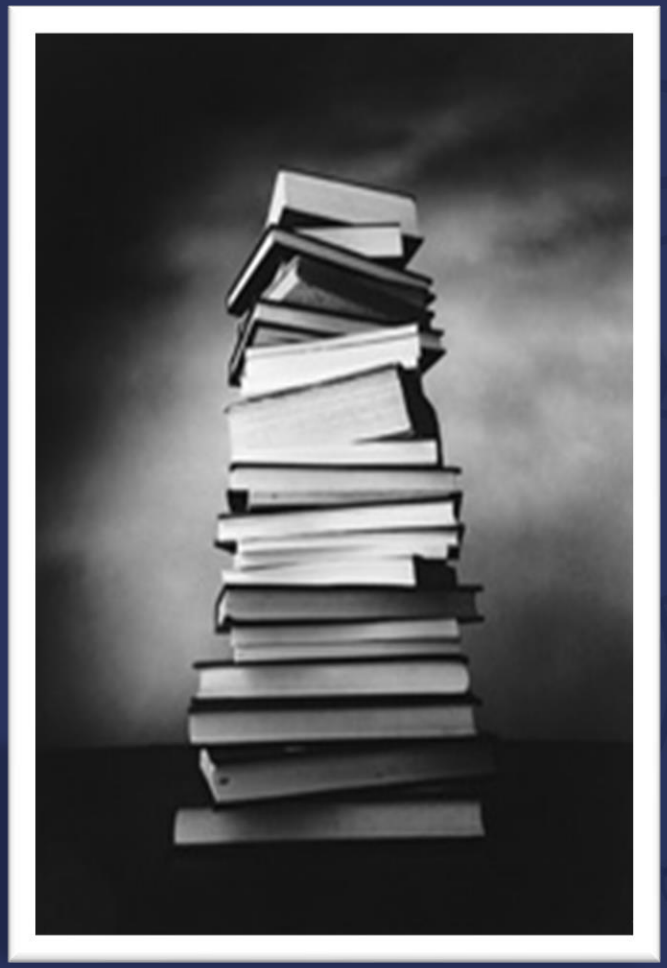
Schools need to make learning materials universally accessible
Nov. 17, 2019 Seattle Times

I'm a college sophomore and I haven't read a print book since eighth grade.

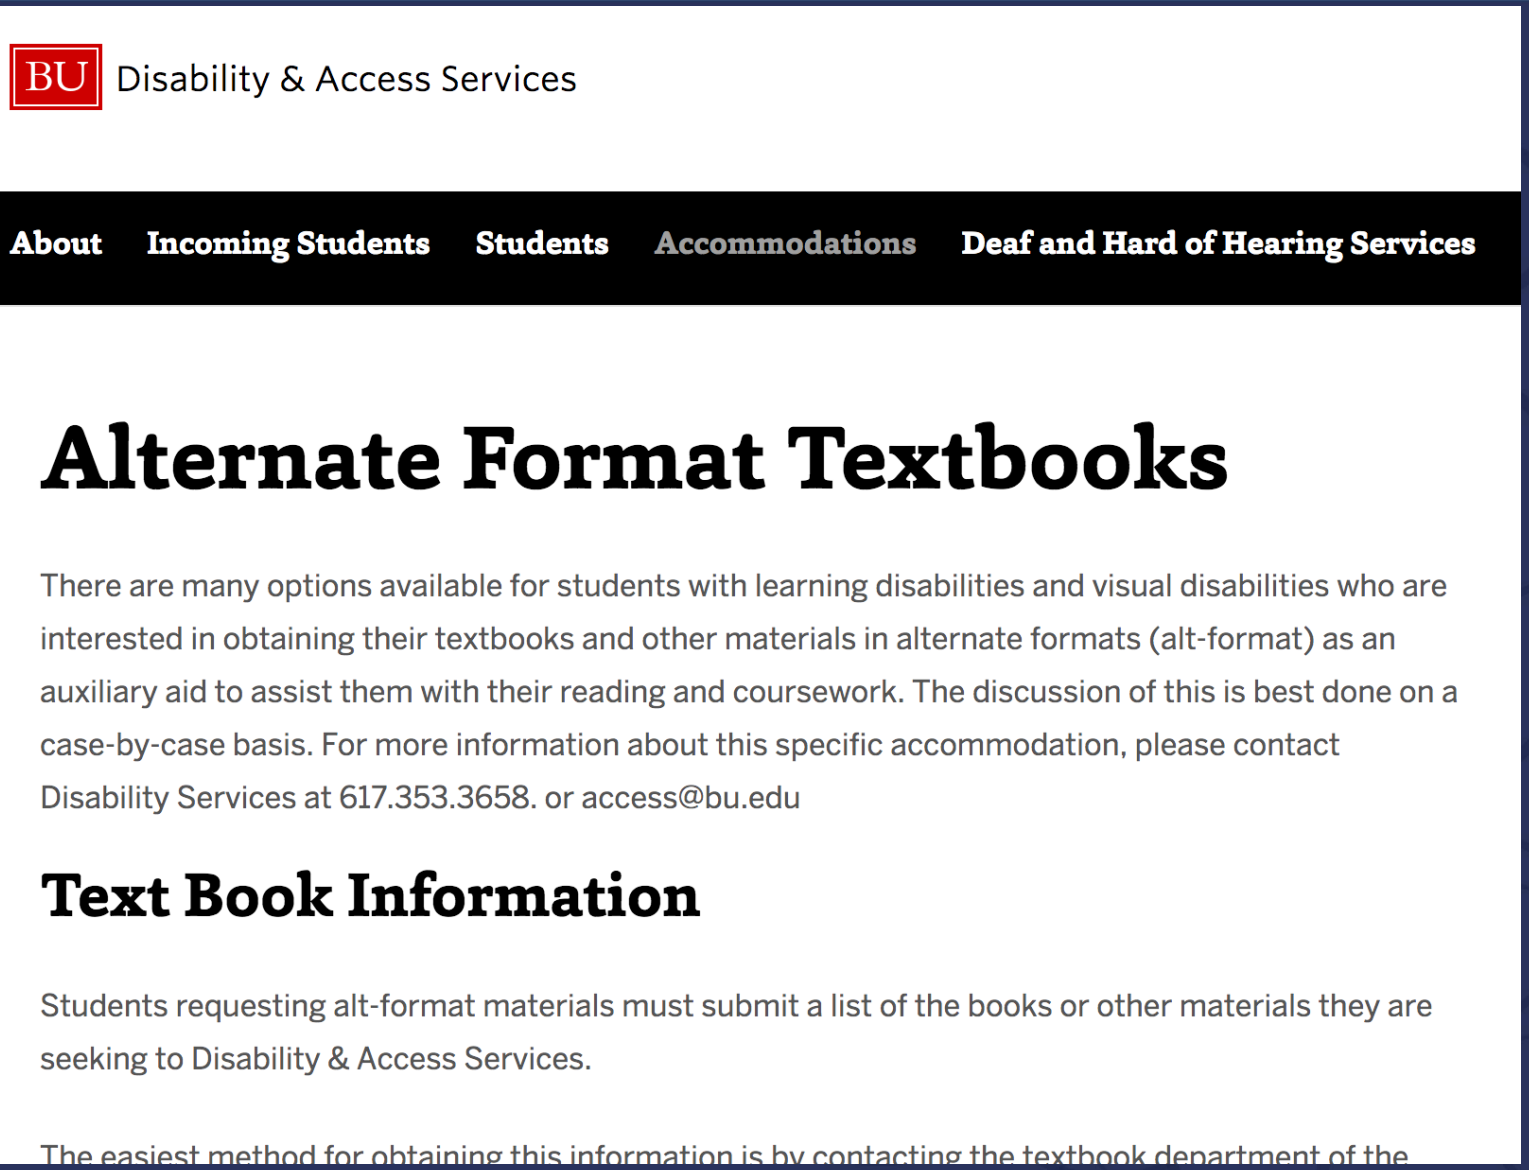
What are the downsides of remediation?

Federal NIMAS Legislation

The National Instructional Materials Accessibility Standard



…addresses the national need to increase the availability and timely delivery of print instructional materials in accessible formats to blind or other students with print disabilities in elementary and secondary schools.



BU Disability & Access Services

About | Incoming Students | Students | Accommodations | Deaf and Hard of Hearing Services

Alternate Format Textbooks

There are many options available for students with learning disabilities and visual disabilities who are interested in obtaining their textbooks and other materials in alternate formats (alt-format) as an auxiliary aid to assist them with their reading and coursework. The discussion of this is best done on a case-by-case basis. For more information about this specific accommodation, please contact Disability Services at 617.353.3658. or access@bu.edu

Text Book Information

Students requesting alt-format materials must submit a list of the books or other materials they are seeking to Disability & Access Services.

The easiest method for obtaining this information is by contacting the textbook department of the

https://www.bu.edu/disability/accommodations/procedures/specific/alternate-format-textbooks/

March 1: Individual Differences in Neural Networks (2)
Topic: Strategic Networks and Executive Function
Notes compiled by Michelle Berkovitz

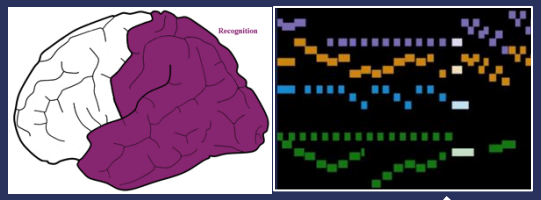
Ruth as an example of individual differences:

- She has perfect pitch.
- Studies have shown that people with a perfect pitch have an enlarged area devoted to perfect pitch right along the temporal auditory cortex.
- There's a very large area on the left side, but small area on the right side devoted to perfect pitch, which seems to be characteristic of people who have perfect pitch.
- A person with perfect pitch can identify a pitch as exactly b-flat, for example. They automatically code in pitches rather than melodies (as most people do).
- People with perfect pitch are oftentimes musicians. In most cases, this characteristic is an asset to the music profession.
- Most people are able to recognize relative pitches, their patterns, but not their absolute pitch.
- Ruth would see Professor Rose as disabled in not having this ability.
- Context is everything! A person's disabilities can be seen as an interface with their context.
  - For example, when in Church, Ruth will just not sing because fighting against the incorrect pitches that others are singing is too frustrating and overwhelming.
- Is perfect pitch all biology? All learning? It's very difficult to tell.
  - Studies have shown that if people with perfect pitch are not living in an environment or culture where pitch is important, this skill will decline or be lost. Conversely, in cultures that value pitch, these skills are found to have an even more elevated perfect pitch.

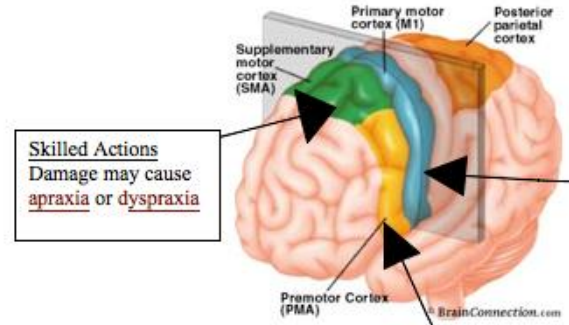
Strategic Networks

- In schools we tend to be more concerned with children's abilities to act strategically.
- Victorian Picture from first day of class – Eye movement recordings indicate the different strategic plans we use when looking at images.
  - Why are these plans so different?
    - You make a strategy depending on the question. Questions like: How are the people related? When does this scene take place?

Making Lectures More Universal



I. Provide Multiple Means of Representation
Perception
Language, expressions, and symbols
Comprehension

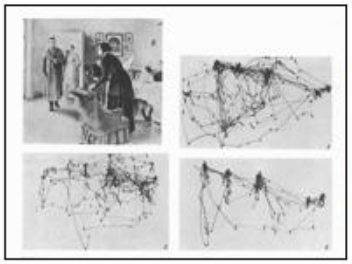


Skilled Actions
Damage may cause apraxia or dyspraxia

Intentional Actions
Primary Motor Cortex – neurons run down the spine; damage may lead to paralysis

Strategic Actions
Premotor cortex
For organized/planned movement or systems of movement

Strategic Action Example: Involving the Visual, Motor, and Prefrontal Cortex



Remember looking at the picture at left in class? The other line-dot pictures are recordings or mappings of a person looking at the same picture. Why the different 'looking strategies?' Because of the different 'contexts' in which the person was asked to look at the picture. (i.e. *How many people are in the photo?* vs. *What kind of room is it?*).

What about an infant's looking strategies?

This is a baby at one month (top) and two

Lecture Notes for February 14, 2006 – Valentine's Evening

The Author

Hi. My name is Chris. In case you missed it, or simply want to relive it – here's what happened on Tuesday night:

I am wearing a blue shirt. It's from the State of New Jersey - Department of Central Services. I stole it form my mom's laundry basket. I also am wearing jeans and new boots.

Dr. Rose enters the room at 7:02 pm.

I am seated next to Kati Blair. She wears a black top with green pants. And glasses. And a bracelet. And she holds out her necklace, and pulls out a green undershirt.

Kati

Kati asks me for gum. She's out of luck.

It is 7:05.

Kati says, "I forgot we are doing something fun."

Sam sets a bag down on the desk across from me. I suspect here are treats in this bag. Because it looks like there are a bunch of two liter bottles of something green.

Maia has been asked to move to the seat next to me.

Carolina

Carolina takes a picture. Perhaps she is taking notes as well. I have no camera. Yes I do!!! My cell phone!

We begin. It is 7:09.

The Sams are arranging people. It is mysterious. Dr. Rose says to make nametags. There is shuffling and ripping.

There will be drinking involved in tonight's activity, I think. People are passing out cups and opening soda. Kati puts away here laptop and now I am worried. I'd hate to spill Sierra Mist on my Mac.

Dr. Rose: "We are gonna talk about what neural networks are, how they operate." He noticed it was hard to teach neural networks when he first started teaching about them.

Sweet Neuron Nectar

The three sections of Larsen G08 are divided into three layers of neurons. The left side of the class is output. The middle section is the middle layer. The right side is input. We will model neurons. However, the best way to do it would involve spitting on each other. The way it would work is that I would spit at other neurons and get them worked up so they fire. Firing happens when we receive enough stimulus to excite our axons. Instead of spitting, we raise our arms and wiggle our hands.

(There is computer trouble. Dr. Rose doesn't know his password. I am tempted by my Schweppes. But I shouldn't drink. The computer problem is solved.)

We learn that there is constant neural firing going on in our brains. Constantly. It's like background noise. We practice random firing. We giggle. (For tonight's experiment we will reduce background firing.) Any change in this firing is information – an increase, a decrease ~~it~~ reflects a change in the Nervous System's state. Neurons make information by decreasing or increasing their firing.

Tonight, we will only fire when irritated.

Normally, as a network, we all would be connected (a typical neuron has 10,000 connections).

Class notes
3/22/05

- Begins speaking of condition where thin layer of cortex/brain surrounds empty space: Orange Rind syndrome. Even with O.R., brain may operate with surprising efficiency. Drs. had expected severe disabilities.
- Brain is integrated and adaptive, to a large degree, can compensate and adjust to deficiencies.

"I don't know how to tell you this, but it looks like you have a brain the size of a seafood."

- Build-up of Cerebral-Spinal Fluid can cause problems for developing brain, e.g., hydrocephalus.
- Important question: What are strengths in face of recognized weaknesses?
- Dx is not an exact science in all cases.

"What about that! His brain still uses the old vacuum tubes."

- David read Auden poem (anti-war message): Ode to the Diencephalon
- Discussion of doctoral thesis study of children with only right or [redacted]
- Children functioning surprisingly well.

"Mama and I fixed a lovely dinner. I used the right side of my brain, and she used the left side of her brain."

- Some otherwise compromised compensate by developing advanced prosodic recognition. Child w/right brain only very superior abilities.

Bob Gibbons,
Sloan School of Management
MIT

No readings.

Before Class: Short Video Lectures posted

- For each video, discussion question added
- Students answer half the questions
- Short answers, 24 hours ahead.

During Class:

- Prof. picks some answers to discuss,
- Sets up an order for best discussion
- Benefit: Both student and teacher have time to reflect and plan ahead

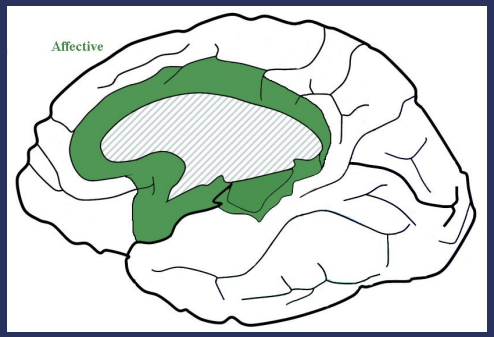
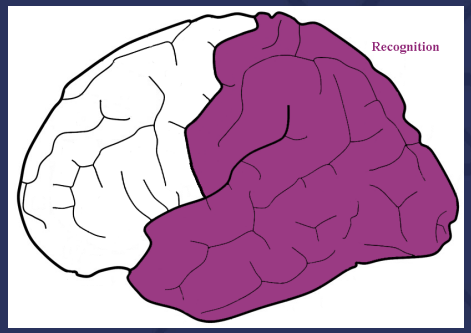
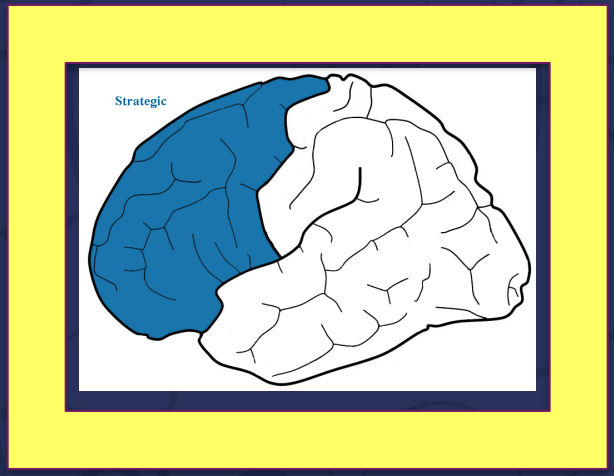
What does accessibility mean at Zoom?
At Zoom, we strive to ensure that people of all abilities can meet and collaborate with one another by taking into consideration the wide range of hearing, vision, mobility, and cognitive abilities. Our teams adhere to the WCAG 2.1 AA recommendations while designing and developing every feature to ensure that accessibility considerations are not just nice-to-haves, but requirements in our development process.
How does Zoom ensure accessibility in its products?
Zoom's design and development process expect that newly introduced features are made accessible from the very beginning. The accessibility team collaborates with the product and engineering teams at every stage of the release process. We believe accessibility should begin at the design phase, where fundamental accessibility issues can be identified and addressed as early as possible. The accessibility team tests with screen readers and with keyboard-only, and works in tandem with developers to ensure that all releases are compatible with as many assistive technologies as possible.
If issues with accessibility arise, how does Zoom plan on remediating the accessibility issues?
Zoom is constantly gathering feedback from users to identify areas where there is a mismatch between our products and our users' abilities. If accessibility bugs exist, Zoom will work with users and customers to identify the most critical accessibility issues and incorporate them into the roadmap. While timelines will depend on the severity of issues, Zoom takes “showstopper” issues (issues that make it impossible for users with disabilities to access information) very seriously and will ensure that those issues are of highest priority in the Zoom roadmap.

Where do the three principles come from?

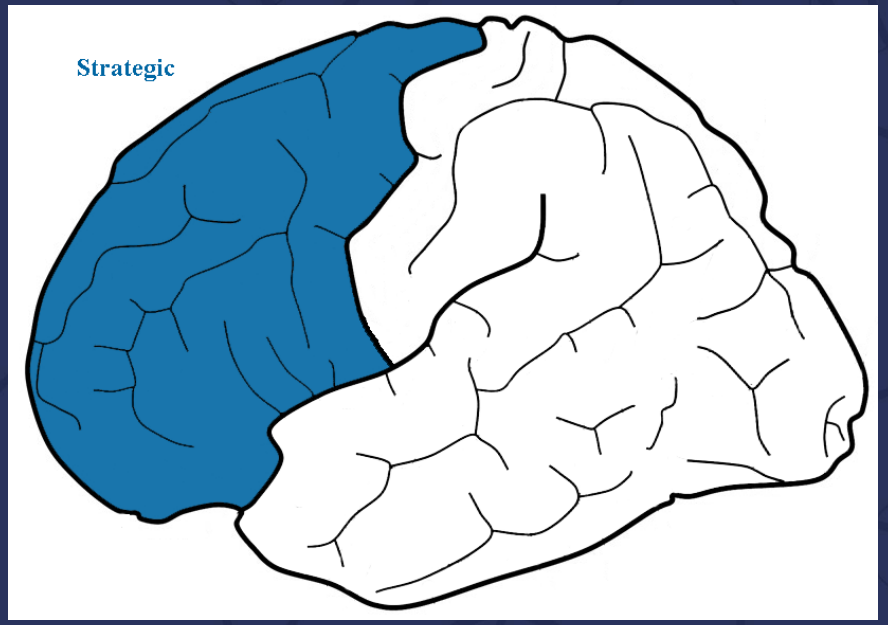






Strategic (Frontal) Cortex
How to DO that?

Planning, organizing and executing skillful actions in the environment



Late to Develop, Early to Degrade

IMPRESSION/SUMMARY: In summary Mr. Rose is a 72-year-old former neuropsychologist who is been having cognitive and memory difficulties for the past year to 2. On my testing he scored a 25 out of 30 on the MOCA. Consistent with mild cognitive impairment. This may be amnestic subtype though he did have some executive difficulties. His formal language testing was considered normal but did have some difficulties with some slight pauses in his overall speech I was only able to name 16 animals and 12 words beginning of F. His remaining neurological examination is unremarkable no evidence of any hallucinations or extrapyramidal features.

- NEUROLOGICAL EXAM
  MS: His language was fluent but slightly slow and hesitant. He scored a 25 out of 30 on the MOCA losing 1.4 trails, digit span back and 3 points for delayed recall. He named 12 words beginning with F, 16 animals with one repetition. Boston naming was 15 out of 15. On the I Boca he was 5 out of 5 on the visual association recall and recognition.

T-560 Final Project

Scaffolding the Project

Final Product!
Incorporating Feedback
&
Integrating Multiple Means of Engagement
Due Tuesday, May 12th by 5:00 pm

Ning Group post: Submit a final version of your project, making sure to incorporate the feedback that you received on your second draft. We expect that your over-arching ideas, your uses of multiple means of representation and your uses of multiple means of action and expression will be fully developed. Finally, we would like you to integrate the last UDL principle: **multiple means of engagement**.

Here are your goals for each component. Please post this final product on your **Ning Group page**. Please use the modes of expression (i.e. writing, speaking, and/or drawing) that allow you to best fulfill the goals of this final product.

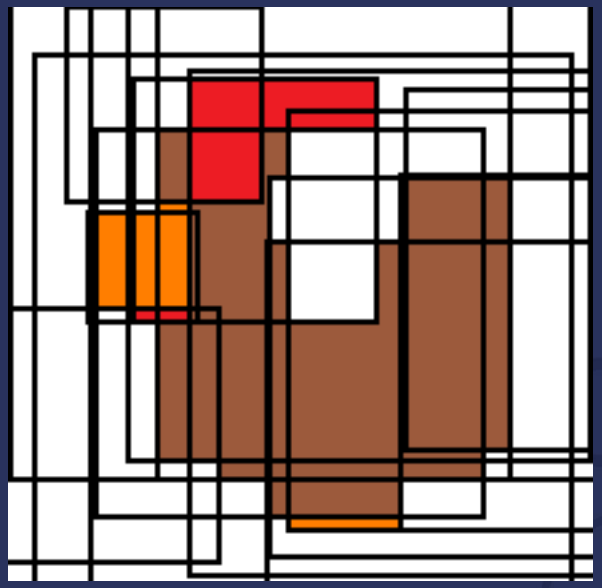
Component	Your goals for this final version
Statement of your product's goal	• The goal of your product is clear and has been guiding your design decisions around the 4 components of your product. All the following details are present: o What population of learners are you targeting? o What content/skill area are you focusing on? o What is the context in which your product will take place? (who will be using it, where, under what conditions?) o How will you assess if it's been effective?
Working Model/Prototype	• The description of how your product works/what it looks like is fully developed. • Links to standards are clear. • Your ideas for incorporating multiple means of representation and multiple means of action and expression

Scaffolding the Project

Component #3: Multimedia Brochure/Video

	Does not meet expectations	Meets some of the expectations	Meets all expectations	TF Comments
Presentation				
Goals and Product Description	The educational goals of the product are not included or are unclear; the description of the product and who/what it is designed for is not included or is unclear	The educational goals and description of the product are included, but may lack clarity, specificity or depth; potential users have some idea of what they would be receiving	The educational goals and description of the product are clearly shown throughout the video in an engaging way; potential users know exactly what they would be receiving	
Key Features Highlighted	None of the key features of the product are highlighted; no connections to UDL guidelines/checkpoints are made; the brochure/video (or highly detailed storyboard) is vague and fails to engage the viewer in a meaningful way	The key features are highlighted, but may lack specificity or clarity; connections to UDL guidelines/checkpoints are made at times; the brochure/video (or highly detailed storyboard) is mostly engaging and clear; schools and districts might consider using this product	The key features are well chosen and highlighted with vivid detail and supporting examples; connections to UDL guidelines/checkpoints are made throughout; the brochure/video (or highly detailed storyboard) is engaging and clear throughout; this product is a must-have for any school or district	
Incorporation of the UDL Engagement Guidelines to address individual differences:				
Guideline 7: Provide options for recruiting interest	Fails to demonstrate how the product provides options for recruiting interest; these	Does a good job of highlighting the ways in which the product provides options for recruiting interest to address learner	Does an outstanding job of highlighting the myriad ways in which the product provides options for recruiting interest	

Scaffolding the Group Process



Team Learning Assessment Rubric

T560

Based on R. Elmore's course on supporting teachers for instructional change

T-560 Semester long project

Goal: In teams of 4-5, develop an educational intervention of their choice that supports robust disciplinary thinking within a particular content area for *all* students. The final product that consists of four interrelated parts:

1. Working prototype or highly detailed mock-up of the intervention
2. Multimedia "brochure"
3. Research white paper
4. Implementation guide

Barriers

- Challenging group dynamics that need to be addressed early on
- "Group think" could take over and lead to teams not pushing themselves
- Logistics of working in a team

Group Learning Rubric

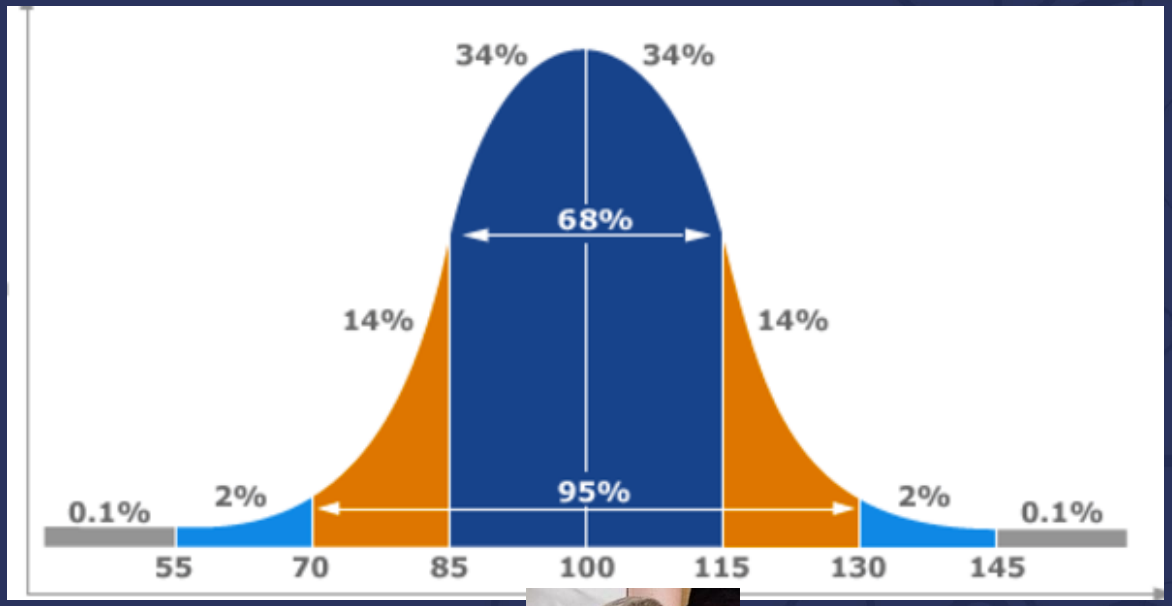
Dorenkamp, M. A., & Vik, P. (2018). Neuropsychological assessment anxiety: A systematic review. *Practice Innovations, 3*(3), 192–211.

Abstract

Older adults are the fastest growing population seeking cognitive assessment services, primarily regarding cognitive concerns and capacity to live independently. Neuropsychological assessment can evoke stress/anxiety in patients, and anxiety has been implicated in poor test performance. A review of the literature failed to identify empirical articles dedicated to the impact of a patient's awareness of the purpose and potential implications of a neuropsychological evaluation on test performance. This article systematically reviewed literature regarding anxiety/stress to understand what anxiety domains threaten performance, and identify vulnerable cognitive abilities. Seventy-eight articles were reviewed. Sixty anxiety/stress measures were used and were classified into 7 domains: global, trait, state, social, test, and math anxiety, and stress. There were 149 neuropsychological tests that were used and classified into 13 domains: academic achievement, attention, executive functioning (inhibition/switching and reasoning/fluency), full scale intelligence, language, memory (overall, verbal, and visual), mental status exams, motor, perception, processing speed, verbal comprehension, and working memory. Results revealed that (a) most studies examined healthy adult populations, (b) few studies used clinical samples, and (c) no studies focused on older adults from clinical populations. Of the studies reviewed, nearly 2/3 reported some relationship between test performance and anxiety. Test, social, state, and math anxiety were most often associated with poor test performance. Verbal memory, attention, inhibition, and working memory were most consistently associated with anxiety. Findings highlight the importance of attending to anxiety in older adults referred for neuropsychological evaluation and the need for anxiety assessment measures that are sensitive to aging patients' concerns.

Where am I headed on the spectrum?



Hypo Anxious/Fearless

Hyper Anxious/Phobic

Provide Multiple Means of Engagement

Purposeful, motivated learners

Provide options for self-regulation

- Promote expectations and beliefs that optimize motivation
- Facilitate personal coping skills and strategies
- Develop self-assessment and reflection

Provide options for sustaining effort and persistence

- Heighten salience of goals and objectives
- Vary demands and resources to optimize challenge
- Foster collaboration and community
- Increase mastery-oriented feedback

Provide options for recruiting interest

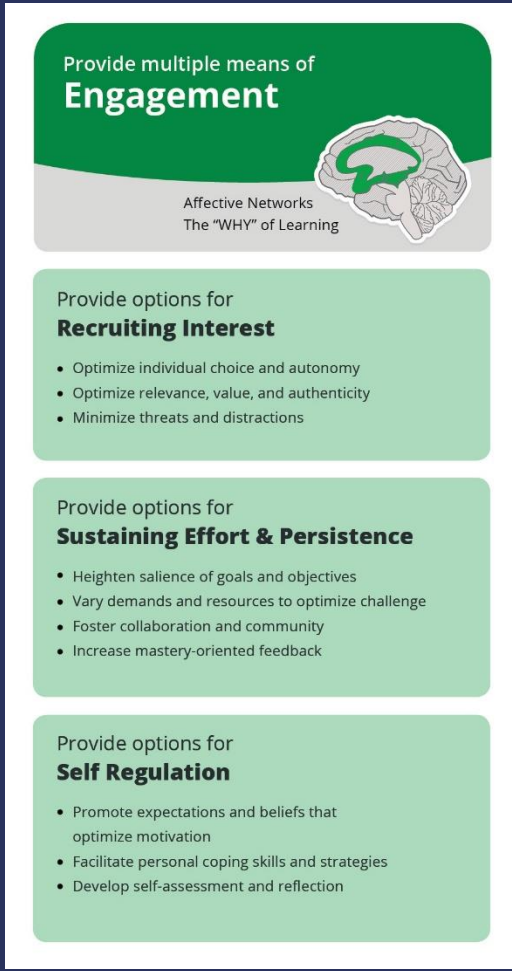
- Optimize individual choice and autonomy
- Optimize relevance, value, and authenticity
- Minimize threats and distractions

Teaching as Emotional Work

The most important functions of emotions—especially for humans and other mammals—is to prioritize what we *learn*. While emotions have effects throughout the body, it is their effects on the brain—on what we learn (and don't learn)—that is their most powerful effect. Indeed, some researchers emphasize that the critical role of emotions is to provide "learning signals" that alert the brain that something is important enough to attend to and learn.

The Influences of Emotion on Learning and Memory

Chai M. Tyng, Hafeez U. Amin, Mohamad N. M. Saad, and Aamir S. Malik (2017)*



The "why" of learning

Examples:

- Make assignments relevant (recruiting interest);
- give lots of choice
- Critical peer feedback sessions (effort & persistence)
- Assessing oneself using a rubric before handing in an assignment (self-regulation)

Recursive Processes in Self-Affirmation: Intervening to Close the Minority Achievement Gap

Geoffrey L. Cohen[1,*], Julio Garcia[1], Valerie Purdie-Vaughns[2], Nancy Apfel[3], Patricia Brzustoski[3]

Challenge of a self-reinforcing cycle – threat of low performance impairs performance, which increases threat, which lowers performance…
Can an intervention interrupt the cycle? >> Can we change the nature of the interaction with school tasks?

Writing activity about "your ideas, your beliefs, and your life." Choose the values most and least important to you. Focus on the value most important to you. Think about a time when this value was important to you. In a few sentences, describe why the selected value is important to you.
(3-5 times a year in seventh grade)

African-American students who received the intervention showed a significant improvement on GPA over TWO YEARS, and this was particularly pronounced for students with lower initial achievement levels. No effect for European Americans.

- Self-regulation

3) Additional Individual Options:

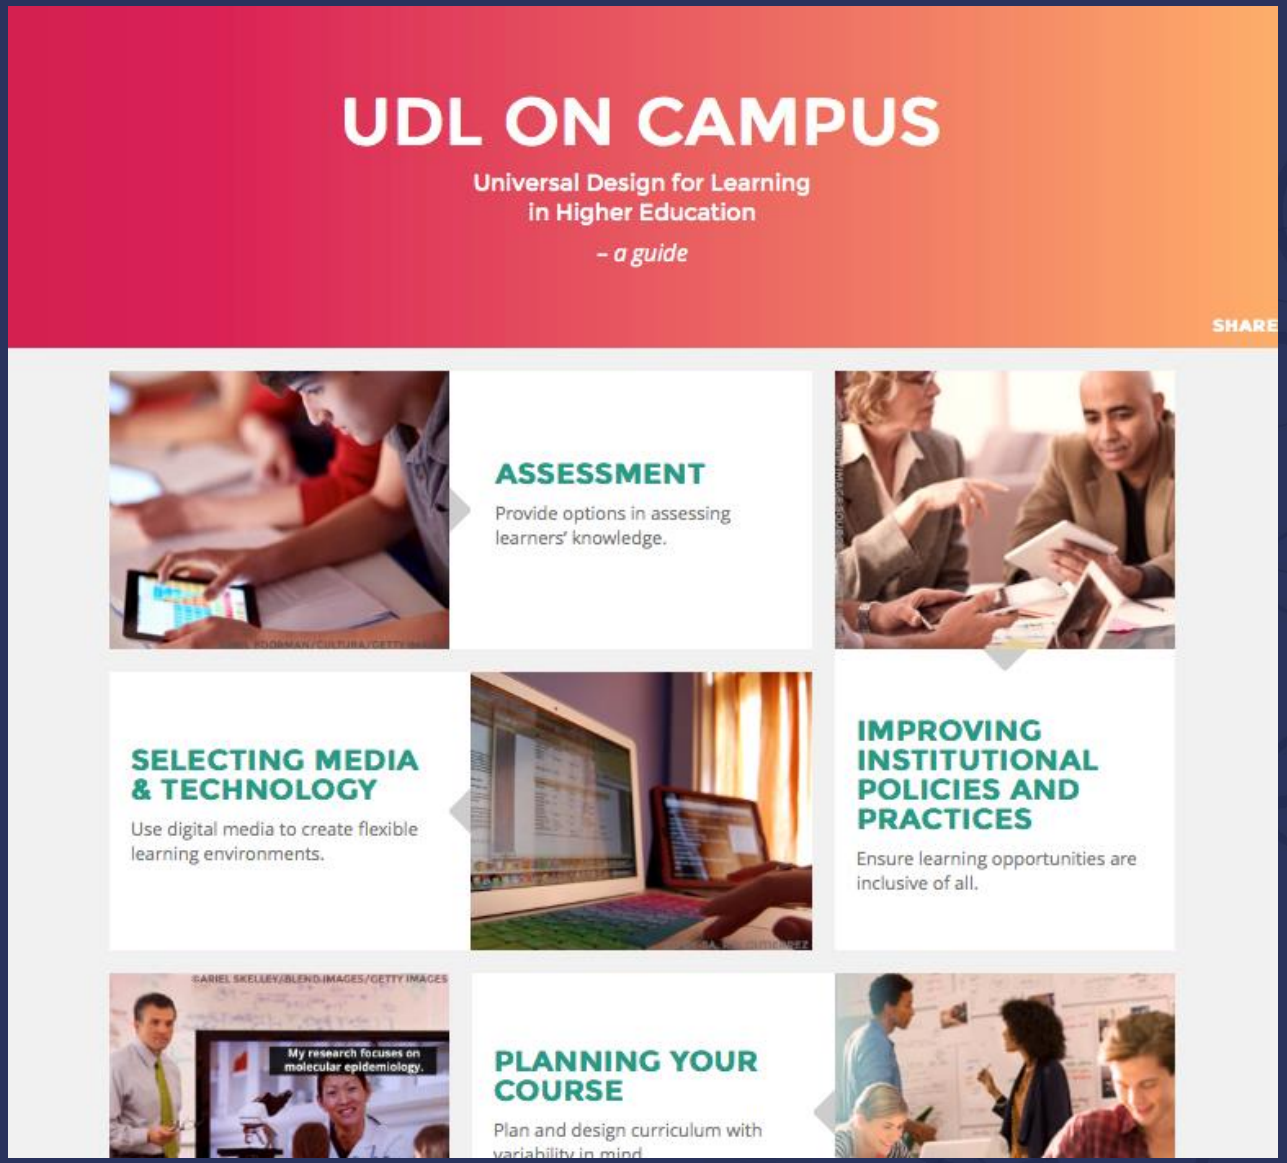
Individuals may contribute to building an active community of practice in the course by such options as: 1) taking (and publishing) notes of the whole class presentations or meetings of the Advanced Consulting Groups, 2) creating videos of key observations or practices, 3) preparing brief presentations or media for the Advanced Consulting Groups, 4) Leading social media discussion groups on specialized topics of interest, etc.

National Policy: Higher Education Act

Section 103(24) **UNIVERSAL DESIGN FOR LEARNING**. The term 'universal design for learning' means a scientifically valid framework for guiding educational practice that—

(A) provides flexibility in the ways information is presented, in the ways students respond or demonstrate knowledge and skills, and in the ways students are engaged; and

(B) reduces barriers in instruction, provides appropriate accommodations, supports, and challenges, and maintains high achievement expectations for all students, including students with disabilities and students who are limited English proficient.



udloncampus.cast.org/home

- Make the connection with stereotype threat. Prove that I have lost it. My score goes down. Expectancy effects too. Looking for strengths?
- Autism in all three? Certainly in overwhelmed, but also anxiety.

- Let's look at a lecture. Sensory, language, comprehension. (can repeat, connect to other sources, etc. Always provide more background, Connect to real life, etc use analogies.
  - How to improve lectures: make them multiple reps
  - For one thing, make the slides multiple reps. Not outlines alone, but lots of images. Another rep
  - Give them ahead, accessible slides, etc. Weaken slides if just same text . Embed videos.
  - The lecture intelfe: post it on Google, let Google translate work, have one student fix it.

RECOMMENDATIONS:

Issue #1 MILD COGNITIVE IMPAIRMENT. His performance as well as his history are suggestive of mild cognitive impairment possibly amnestic or executive subtype. We did discuss the natural history of patients with mild cognitive impairment. I talked about further workup and evaluation including MRI scan, CSF analysis, neuropsychological testing, As well as enrolling in some research projects.

I talked to him about other lifestyle changes this includes daily physical activity, keeping mentally active and engaged, and a heart healthy Mediterranean diet.

IMPRESSION/SUMMARY: In summary Mr. Rose is a 72-year-old former neuropsychologist who is been having cognitive and memory difficulties for the past year to 2. On my testing he scored a 25 out of 30 on the MOCA. Consistent with mild cognitive impairment. This may be amnestic subtype though he did have some executive difficulties. His formal language testing was considered normal but did have some difficulties with some slight pauses in his overall speech I was only able to name 16 animals and 12 words beginning of F. His remaining neurological examination is unremarkable no evidence of any hallucinations or extrapyramidal features.

- NEUROLOGICAL EXAM
  MS: His language was fluent but slightly slow and hesitant. He scored a 25 out of 30 on the MOCA losing 1.4 trails, digit span back and 3 points for delayed recall. He named 12 words beginning with F, 16 animals with one repetition. Boston naming was 15 out of 15. On the I Boca he was 5 out of 5 on the visual association recall and recognition.
  CN: EOMI, PERRL, VFFTC, Face symmetrical. Tongue and uvula midline. Hearing intact.
  MOTOR: No drift. No adventitious movements. FFM and RAM are rapid. Full power throughout.
  SENSORY: Intact to LT
  DTR: Symmetrical throughout. Plantars are downgoing.
  COORDINATION: FFM, RAM, dysmetria, dysdidokokinesia.
  GAIT: Narrow based and steady.

RECOMMENDATIONS:

Founder & Editor-in-Chief

President Trump recently underwent his annual physical checkup. At Trump's apparent insistence, the physician also administered a test of cognitive ability, the Montreal Cognitive Assessment (MoCA).

Some are citing this test to demonstrate that Trump does not have a mental illness or any other personality disorder. However, what does this test really tell us about the president's mental health?

Developed in the early 2000s at Montreal's McGill University by a group of researchers, the Montreal Cognitive Assessment (MoCA) is a simple paper-and-pencil test meant to detect mild cognitive impairment and cognitive degenerative diseases such as Alzheimer's. It takes about 10 to 12 minutes to complete and is indicated
